REVISION HISTORY

Document Release	Date	Revision	Initials
0.92	12/9/98	Initial internal release	DH
0.93	12/16/98	Updated pinouts to match engineering rev 0.5 document dated 12/1/98	DH
0.94	1/20/99	Updated pinouts to match engineering rev 0.8 document dated 12/22/98	DH
1.0	6/4/99	Added 133 MHz Support to Feature Bullets Updated / Fixed Pin Descriptions: Fixed description of strap options on MA2, MA8, and MA11-14; Removed Auxiliary Memory Port; Added REQ/GNT[4-7]#; Added GND & VCC3 pins to increase pin count to 510 (updated mech spec); Fixed definitions of RESET# & CRSTI# and changed CRSTI# to CPURSTD#; Removed PWRGD function from SERR#; Fixed definitions of SRAS#, SCAS#, and SWE#; Added note to PLLTST description Updated Device 0 Rx50-53, 68[4], 69, 6B[5-1], 6C[7-4], 70[3,0], 72[0], 76[7], 79[1-0], 7A (added); Device 1 Rx41[0], 42[0]	DH
1.1	6/23/99	Updated feature bullets & overview and fixed misc formatting problems Fixed REQ/GNT4# pinouts and CKE & DQM naming polarity Device 0 Bus 0 updated Rx2-3 Device ID, 69[7-6], 6D[6-5], 76[6] Device 0 Bus 0 added Rx2C-D, 2E-F, 50[1], 51[5], 53[2], removed 6E-6F Device 0 Bus 1 updated Rx0-3 Vendor & Device ID, Rx7-6[7] Removed AC timing specs	DH
1.11	7/8/99	Fixed pin descriptions of CPURSTD# and SUSP	DH
1.2	8/23/99	Fixed typo in device 0 Rx50[7] description; added comment about default state Fixed system freq divider settings (MA pin descriptions, Dev 0 Rx68[1-0])	DH
1.3	9/8/99	Fixed strap options on MA2-6 and MA13 pin descriptions Fixed Device 0 Rx52[7] strap option and removed (reserved) Device 0 Rx52[5] Removed "VIA Confidential" watermark	DH
1.4	2/2/00	Added DSTN modes to intro/overview panel interface section Removed incorrect notes under CPU interface pin descriptions Fixed MA11 strapping and VCC3/VSUS3 pin descriptions Fixed Device 0 Bus 0 Rx50[1] and Rx51[1] defaults Fixed Electrical Specs absolute max temp ratings	DH
1.5	10/24/00	Changed product name to Apollo PLE133; Fixed typos in pinout table Changed temp specs to be based on case instead of ambient; added power table Changed orientation of pin 1 in mech diagram to match part marking	DH
1.6	11/1/00	Fixed product name on cover page; Fixed strap descriptions Fixed Rx50[7], Rx68[1-0], 6B[4], 6C[4], D0Bus1 Rx4[9], Graphics CR39[0]	DH
1.7	12/1/00	Removed EDO, FP, VCM and PC66 DRAM support (no longer fully tested) Added VIA Cyrix III CPU to supported CPUs list and changed 686A to 686B Added PLLTST pin I/O type Fixed table formatting errors introduced as a result of Word 2000 upgrade Fixed Rx6B[4] and 6C[4]; Fixed spelling errors in Functional Description	DH
1.71	4/26/01	Fixed various typographical and formatting errors	DH
1.8	7/3/01	Updated company address; updated processors list Removed LVDS and direct panel drive support; removed MA3-6 straps Fixed SUSP pin description; Fixed Device 0 Rx6A; moved VGA regs intro	DH
1.81	10/8/01	Clarified the difference between chipset name and north bridge part number Changed "VIA Cyrix III" to "VIA C3"; Fixed max memory to be 1.5GB Updated Device 0 Rx68[4], 69[7-6, 1], 6B[1]; Updated chip marking specs	DH
1.82	10/22/01	Fixed strap pin definitions for MA14,12,11 & updated Rx50[7], 68[1-0] to match	DH
1.83	4/22/02	Updated cover and page header logos; updated legal page addresses and phone #'s	DH
1.84	7/22/02	Fixed Device 0 Rx50[7]	DH
1.85	12/10/04	Added lead-free package in Mechanical Specifications	VL
1.86	4/22/05	Revised top marking of Mechanical Specifications	SV

APOLLO PLE133 NORTH BRIDGE

133 / 100 / 66 MHz

Single-Chip Socket-370 PCI North Bridge,
 With Integrated AGP 2D / 3D Graphics Accelerator
 and Advanced Memory Controller
 supporting PC133 / PC100 SDRAM
 For Desktop PC Systems

PRODUCT FEATURES

• General

- 510 BGA Package (35mm x 35mm)
- 2.5 Volt core with 3.3V CMOS I/O
- Supports GTL+ I/O buffer Host interface
- Supports separately powered 5.0V tolerant interface to PCI bus and Video interface
- 2.5V, 0.25um, high speed / low power CMOS process
- PC98 / 99 compatible using VIA VT82C686B (352-pin BGA) south bridge chip for Desktop and Mobile applications
- 133 / 100 / 66 MHz CPU Front Side Bus (FSB) Operation

• High Integration

- Single chip implementation for 64-bit Slot-1 and Socket-370 CPUs, 64-bit system memory, 32-bit PCI with integrated 2D / 3D GUI accelerator
- **Apollo PLE133** Chipset: **VT8601A** system controller and **VT82C686B** PCI to ISA bridge
- Chipset includes dual UltraDMA-100 / 66 / 33 EIDE, AC-97 link, 4 USB ports, integrated Super-I/O, hardware monitoring, keyboard / mouse interfaces, and RTC / CMOS

• High Performance CPU Interface

- Supports VIA C3 and Intel Celeron™ and Pentium III™ processors
- 133 / 100 / 66 MHz CPU Front Side Bus (FSB)
- Built-in PLL (Phase Lock Loop) circuitry for optimal skew control within and between clocking regions
- Five outstanding transactions (four In-Order Queue (IOQ) plus one input latch)
- Supports WC (Write Combining) cycles
- Dynamic deferred transaction support
- Sleep mode support
- System management interrupt, memory remap and STPCLK mechanism

CPU	DRAM	GUI Core	Internal AGP	PCI	Comments
133 MHz	133 MHz	100 MHz	66 MHz	33 MHz	Synchronous (DRAM uses CPU clock)
133 MHz	100 MHz	100 MHz	66 MHz	33 MHz	Pseudo-synchronous (DRAM uses GUI clock)
100 MHz	133 MHz	100 MHz	66 MHz	33 MHz	Pseudo-synchronous (DRAM uses GUI clock)
100 MHz	100 MHz	100 MHz	66 MHz	33 MHz	Synchronous (DRAM uses CPU clock)
100 MHz	66 MHz	66 MHz	66 MHz	33 MHz	Pseudo-synchronous (DRAM uses GUI clock)
66 MHz	100 MHz	100 MHz	66 MHz	33 MHz	Pseudo-synchronous (DRAM uses GUI clock)
66 MHz	66 MHz	66 MHz	66 MHz	33 MHz	Synchronous (DRAM uses CPU clock)

• Internal Accelerated Graphics Port (AGP) Controller

- AGP v1.0 compliant
- Pipelined split-transaction long-burst transfers up to 533 MB/sec
- Eight level read request queue
- Four level posted-write request queue
- Thirty-two level (quadwords) read data FIFO (128 bytes)
- Sixteen level (quadwords) write data FIFO (64 bytes)
- Intelligent request reordering for maximum AGP bus utilization
- Supports Flush/Fence commands
- Graphics Address Relocation Table (GART)
- One level TLB structure
- Sixteen entry fully associative page table
- LRU replacement scheme
- Independent GART lookup control for host / AGP / PCI master accesses
- Windows 95 OSR-2 VXD and integrated Windows 98 / NT5 miniport driver support

• Concurrent PCI Bus Controller

- PCI bus is synchronous / pseudo-synchronous to host CPU bus
- 33 MHz operation on the primary PCI bus
- Supports up to five PCI masters
- Peer concurrency
- Concurrent multiple PCI master transactions; i.e., allow PCI masters from both PCI buses active at the same time
- Zero wait state PCI master and slave burst transfer rate
- PCI to system memory data streaming up to 132Mbyte/sec
- PCI master snoop ahead and snoop filtering
- Six levels (double-words) of CPU to PCI posted write buffers
- Byte merging in the write buffers to reduce the number of PCI cycles and to create further PCI bursting possibilities
- Enhanced PCI command optimization (MRL, MRM, MWI, etc.)
- Forty-eight levels (double-words) of post write buffers from PCI masters to DRAM
- Sixteen levels (double-words) of prefetch buffers from DRAM for access by PCI masters
- Supports L1/L2 write-back forward to PCI master read to minimize PCI read latency
- Supports L1/L2 write-back merged with PCI master post-write to minimize DRAM utilization
- Delay transaction from PCI master reading DRAM
- Read caching for PCI master reading DRAM
- Transaction timer for fair arbitration between PCI masters (granularity of two PCI clocks)
- Symmetric arbitration between Host/PCI bus for optimized system performance
- Complete steerable PCI interrupts
- PCI-2.2 compliant, 32 bit 3.3V PCI interface with 5V tolerant inputs

• Advanced High-Performance DRAM Controller

- DRAM interface synchronous or pseudosynchronous with CPU FSB speed of 133 / 100 / 66 MHz
- DRAM interface may be faster than CPU by 33 MHz to allow use of PC100 with 66 MHz Celeron CPU or use of PC133 with 100 MHz VIA C3 or Intel Pentium II or Pentium III CPU
- DRAM interface may be slower than CPU by 33 MHz to allow use of older memory modules with a newer CPU
- Concurrent CPU, AGP, and PCI access
- Different DRAM timing for each bank
- Dynamic Clock Enable (CKE) control for SDRAM power reduction in high speed systems
- Mixed 1M / 2M / 4M / 8M / 16M / 32MxN DRAMs
- 6 banks DRAMs supported up to 1.5GB (256Mb DRAM technology)
- Flexible row and column addresses
- 64-bit data width only
- 3.3V DRAM interface with 5V-tolerant inputs
- Programmable I/O drive capability for MA, command, and MD signals
- Two-bank interleaving for 16Mbit SDRAM support
- Two-bank and four bank interleaving for 64Mbit SDRAM support
- Supports maximum 8-bank interleave (i.e., 8 pages open simultaneously); banks are allocated based on LRU
- Independent SDRAM control for each bank
- Seamless DRAM command scheduling for maximum DRAM bus utilization (e.g., precharge other banks while accessing the current bank)
- Four cache lines (16 quadwords) of CPU to DRAM write buffers
- Four cache lines of CPU to DRAM read prefetch buffers
- Read around write capability for non-stalled CPU read
- Speculative DRAM read before snoop result
- Burst read and write operation
- x-1-1-1-1-1-1 back-to-back accesses for SDRAM from CPU or from DRAM controller
- BIOS shadow at 16KB increment
- Decoupled and burst DRAM refresh with staggered RAS timing
- CAS before RAS or self refresh

- **General Graphic Capabilities**

- 64-bit Single Cycle 2D/3D Graphics Engine
- Supports 2 to 8 Mbytes of Frame Buffer
- Real Time DVD MPEG-2 and AC-3 Playback
- Video Processor
- I²C Serial Interface
- Integrated 24-bit 230MHz True Color DAC
- Extended Screen Resolutions up to 1600x1200
- Extended Text Modes 80 or 132 columns by 25/30/43/60 rows
- DirectX 6 and OpenGL ICD API

- **Graphics Performance**

- Sustained 1M polygons/second and 100M pixels/second
- 30fps DVD playback of 9.8Mbps MPEG-2 video with 30% headroom
- Host Based AC-3 decode at only 8% utilization

- **High Performance rCADE3D™ Accelerator**

- 32 entry command queue, 32 entry data queue
- 4Kbyte texture cache with over 90% hit rates
- Pipelined Single Cycle Setup/Texturing/Rendering Engines
- DirectDraw™ acceleration
- Multiple buffering and page flipping

Setup Engine

- 32-bit IEEE floating point input data
- Slope and vertex calculations
- Back facing triangle culling
- 1/16 sub-pixel positioning

Rendering Engine

- High performance single pass execution
- Diffused and specula lighting
- Gouraud and flat shading
- Anti-aliasing including edge, scene, and super-sampling
- OpenGL compliant blending for fog and depth-cueing
- 16-bit Z-buffer
- 8/16/32 bit per pixel color formats

Texturing Engine

- 1/2/4/8-bits per pixel compact palletized textures
- 16/32-bits per pixel quality non-palletized textures
- Pallet formats in ARGB 565, 1555, or 444
- Tri-linear, bi-linear, and point-sampled filtering
- Mip-mapping with multiple Level-Of-Detail (LOD) calculations and perspective correction
- Color keying for translucency

2D GUI Engine

- 8/15/16/24/32-bits per pixel color formats
- 256 Raster Operations (ROPs)
- Accelerated drawing: BitBLTs, lines, polygons, fills, patterns, clipping, bit masking
- Panning, scrolling, clipping, color expansion, sprites
- 32x32 and 64x64 Hardware Cursor
- DOS graphics and text modes

- **DVD**

- Hardware-Assisted MPEG-2 Architecture for DVD with AC-3
- Simultaneous motion compensation and front-end processing (parsing, decryption and decode)
- Supports full DVD 1.0, VCD 2.0 and CD-Karaoke
- Microsoft DirectShow 3.0 native support, backward compatible to MCI
- No additional frame buffer requirements
- Sub-picture hardware eliminates Run-Length-Decoder and Alpha Blending overhead
- Dynamic frame and field de-interlace filtering for high quality playback on VGA monitors (Bob and Weave)
- Tamper-proof software CSS implementation
- Freeze, Fast-Forward, Slow Motion, Reverse
- Pan-and-Scan support for 16:9 sequence

- **Video Processor**

- On-chip Color Space Converter (CSC)
- Anti-tearing via two frame buffer based capture surfaces
- Minifier for video stream compression and filtering
- Horizontal/vertical interpolation with edge recovery
- Dual frame buffer apertures for independent memory access for graphics and video
- YUV 4:2:2/4:1:1/4:2:0 and RGB formats
- Video Module Interface (VMI) to MPEG and video decoder
- Vertical Blank Interval for Intercast™
- Overlay differing video and graphic color depths
- Minifier Video Module Interface (VMI) to MPEG and video decode
- Display two simultaneous video streams from both internal AGP and VMI
- Two scalers and Color Space Converters (CSC) for independent windows

- **Digital Flat Panel (DFP) Interface**

- 85 MHz Flat Panel Monitor interface supports 1024x768 panels
- Uses external TMDS transmitters for advanced panel interfaces

- **Power Management Support**

- Dynamic power down of SDRAM (CKE)
- Independent clock stop controls for CPU / SDRAM, AGP, and PCI bus
- PCI and AGP bus clock run and clock generator control
- VTT suspend power plane preserves memory data
- Suspend-to-DRAM and Self-Refresh operation
- EDO self-refresh and SDRAM self-refresh power down
- 8 bytes of BIOS scratch registers
- Low-leakage I/O pads

- **Testability**

- Build-in NAND-tree pin scan test capability

SYSTEM OVERVIEW

The **Apollo PLE133** chipset consists of the **VT8601A North Bridge** (described by this document) and the **VT82C686B South Bridge** (described in a separate data sheet). The VT8601A is a PC system logic North Bridge for Socket-370 CPUs with integrated 2D/3D Graphics accelerator. The core logic portion of the chip is based on the VIA Apollo Pro133 with integrated graphics accelerator provided by an industry leading Graphics supplier. The combination of the two leading edge technologies provides a stable, cost-effective, and high performance solution to both the Desktop and Mobile personal computer markets. As shown in Figure 1 below, the Apollo PLE133 will interface to:

- Socket-370 Front-Side Bus (133, 100 and 66 MHz)
- PC133 / PC100 SDRAM Memory Interface
- PCI Bus (33 MHz)
- Analog RGB Monitor with DDC
- Digital Monitor Transmitters (TMDS)
- Video Capture / Playback CODECs

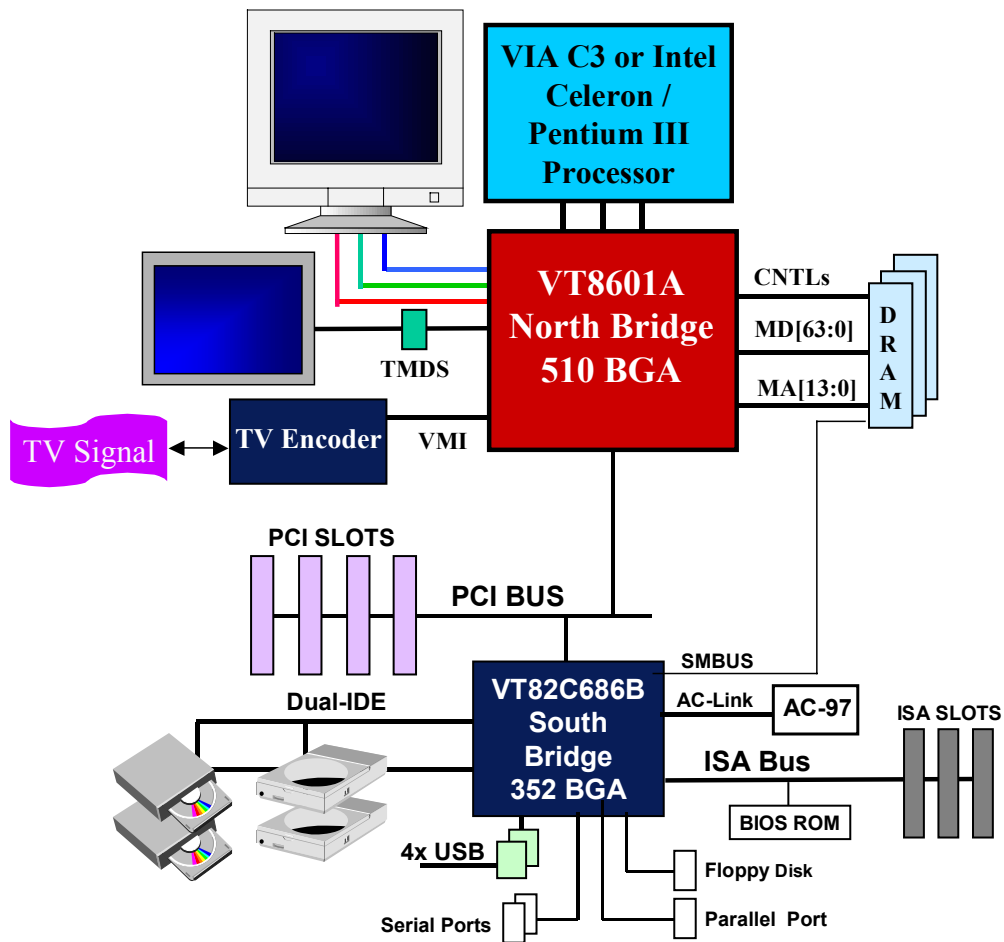

Figure 1: Apollo PLE133 High Level System Diagram

Apollo PLE133 Core Logic Overview

The Apollo PLE133 chipset is a high performance, cost-effective and energy efficient solution for the implementation of Integrated 2D / 3D Graphics - PCI - ISA desktop and notebook personal computer systems from 66 MHz to 133 MHz based on 64-bit Socket-370 VIA C3 / Intel Celeron and Pentium III processors. The complete solution consists of the VT8601A “System Media Accelerator” (SMA) north bridge (510 BGA) and either the VT82C596B (324 BGA) or the VT82C686B (352 BGA) PCI-to-ISA south bridge. Both south bridges are PC98 / PC99 compliant with integrated UltraDMA-66 / 33 IDE, 4 USB ports, and a complete power management feature set. The VT82C686B also integrates HW monitoring, Super-I/O functions (floppy disk drive interface and serial / parallel ports), and AC-97 link supporting digital audio and HSP modem functions.

Apollo PLE133 supports six banks of DRAMs up to 1.5GB. The DRAM controller supports PC133 and PC100 Synchronous DRAM (SDRAM). The Synchronous DRAM interface allows zero wait state bursting between the DRAM and the data buffers at 100 or 133 MHz. The six banks of DRAM can be composed of an arbitrary mixture of 1M / 2M / 4M / 8M / 16M / 32MxN DRAMs. The DRAM Controller is optimized to run synchronous with the CPU Front Side Bus (FSB) frequency of 100 or 133 MHz or pseudosynchronous to the Front Side Bus with the SDRAM and FSB frequencies differing by 33 MHz.

Apollo PLE133 also supports full AGP v1.0 capability with the internal 2D/3D Graphics Engine for maximum software compatibility. An eight level request queue plus a four level post-write request queue with thirty-two and sixteen quadwords of read and write data FIFO's respectively are included for deep pipelined and split AGP transactions. A single-level GART TLB with 16 full associative entries and flexible CPU/AGP/PCI remapping control is also provided for operation under protected mode operating environments. Both Windows-95 VXD and Windows-98 / NT5 miniport drivers are supported.

Apollo PLE133 supports one 32-bit 3.3 / 5V system bus (PCI) that is synchronous to the CPU bus. The chip also contains a built-in AGP bus-to-PCI bus bridge to allow simultaneous concurrent operations on each bus. Five levels (doublewords) of post write buffers are included to allow for concurrent CPU and PCI operation. For PCI master operation, forty-eight levels (doublewords) of post write buffers and sixteen levels (doublewords) of prefetch buffers are included for concurrent PCI bus and DRAM/cache accesses. The chip also supports enhanced PCI bus commands such as Memory-Read-Line, Memory-Read-Multiple and Memory-Write-Invalid commands to minimize snoop overhead. In addition, advanced features are supported such as snoop ahead, snoop filtering, L1 / L2 write-back forward to PCI master, and L1 / L2 write-back merged with PCI post write buffers to minimize PCI master read latency and DRAM utilization. Delay transaction and read caching mechanisms are also implemented for further improvement of overall system performance.

For sophisticated notebook implementations, the Apollo PLE133 north bridge provides independent clock stop control for the CPU / SDRAM, PCI, and AGP buses and Dynamic CKE control for powering down of the SDRAM. A separate suspend-well plane is implemented for the SDRAM control signals for Suspend-to-DRAM operation. Coupled with the 324-pin Ball Grid Array VIA VT82C596B south bridge chip, a complete notebook PC main board can be implemented with no external TTLs.

Apollo PLE133 Graphics Controller Overview

The Apollo PLE133 Graphics Controller is a highly integrated display control device that incorporates a 64-bit 3D/2D graphic engine and video accelerator with advanced DVD video and optional TV output capability. It provides a flexible and high performance solution for graphics and video playback acceleration for various color depth and resolution modes.

The Apollo PLE133 Graphics Controller supports a video capture port to import captured live MPEG 1 or MPEG 2 video streams, or DVD decompressed video streams to be overlaid with a graphics stream of mixed color depth displays. In supporting dual live videos, the Apollo PLE133 Graphics Controller offers independent dual video windows ready for videoconferencing and with linear scaling capability.

Integrating the programmable phase lock loop with high speed LUT DACs, the Apollo PLE133 Graphics Controller is a true price/performance solution for the modern multimedia based entertainment PC.

Capability Overview

The Apollo PLE133 Graphics Controller is a fully integrated CRT and TV 64-bit 2D/3D Accelerator. The high performance graphics engine offers high speed 3D image processing in full compliance and compatibility with IBM® VGA and VESA™ extended VGA. As an integrated controller, it allows unprecedented cost and performance advantages by eliminating the need for an external frame buffer while at the same time gaining local access to a larger amount of memory. Many functions can now be eliminated that previously consumed large amounts of bandwidth.

The Apollo PLE133 Graphics Controller, equipped with a single-cycle 3D GUI Engine, pipelines 3D rendering process architecture in hardware, providing real-time interactions with solid 3D models in CAD/CAM, 3D modeling, and 3D games. It supports all key 3D rendering operations, including: Gouraud shading for smooth object surfaces, texture mapping for realistic object textures, 16-bit hardware Z-buffering for fast 3D depth calculations, and Alpha Blending for transparency effects.

The Apollo PLE133 Graphics Controller's highly innovative design, a full 64-bit memory interface with a high performance graphics engine which can support a RAMDAC™ running up to 230MHz, dramatically improves GUI functions and significantly promotes overall system operation.

The Apollo PLE133 Graphics Controller supports a full AGP implementation internally to remain compatible with existing software and programming models. However, since the engine is integrated it enjoys a higher bandwidth and lower latency than is possible with discrete solutions. AGP operations can include direct access of the system memory by the 2D/3D engine to provide increased texture memory.

To meet the requirements of a PC99 graphics adapter in a multimedia PC, the Apollo PLE133 Graphics Controller supports planar video format for MPEG-1, MPEG-2, and DVD-video playback. The dual video playback is capable of overlaying windows for videoconferencing and multimedia displays. Advanced features of the Apollo PLE133 Graphics Controller, such as color space conversion, video scaling, dual video windows, dual-view display, Video Module Interface (VMI), Vertical Blanking Interleave (VBI), a 24-bit True Color DAC, and triple clock synthesizers allow performance at peak levels.

By using an extended 16-bit VMI port the Apollo PLE133 Graphics Controller can support DTV resolution. This port can operate as either an input for Video Capture or as an output for Video display. The Apollo PLE133 Graphics Controller is capable of supporting three simultaneous displays: CRT, Flat Panel Monitor & Video, each with a different "window" or desktop.

The Apollo PLE133 integrated Graphics Controller supports a rich featured flat panel monitor interface that can be used with external TMDS transmitters to support the latest DVI displays.

System Capabilities

The Apollo PLE133 Graphics Controller's main system features include:

- High Performance single cycle GUI
- Highly Integrated RAMDAC™ and Triple Clock Synthesizer
- Full Feature High Performance 3D Graphics Engine
- High speed internal AGP Bus Mastering data bus supporting DVD video playback & 3D
- Hardware implementation of motion compensation
- Dual Video Windows for Videoconferencing
- TrueVideo® Processor
- DirectDraw™ and DirectVideo™ Hardware Support
- Versatile Motion Video Capture/Overlay/Playback Support
- Flexible Frame Buffer Memory Interface
- Advanced Mobile Power Management
- CRT Power Management (VESA™ DPMS)
- PC99 Hardware Support

High Performance 64-bit 2D GUI

The 64-bit graphics engine of the Apollo PLE133 Graphics Controller significantly improves graphics performance through specialized hardware that accelerates the most frequently used GUI operations and matches the high-speed requirements of CPUs. Functions directly supported in hardware include: BitBLTs, image and text transfer, line draw, short stroke vector draw, rectangle fills, and clipping. The graphics engine supports 256 Raster Operations (ROPs) for up to 32-bit packed pixel graphic modes. The ROP3 Processor in the Apollo PLE133 Graphics Controller is able to perform Boolean functions which allow many additional operations, including transparency, pattern masking, color expansion alignment, and pattern enhancement. Additionally, the graphics engine features linear display memory addressing (up to 4GB memory space), accelerated color expansion modes for graphics text procession, and memory-mapped I/O registers on the graphics engine for faster access time.

Graphic functions are optimized by a 64-bit internal data bus and a four-color hardware cursor/pop-up icon, operating up to a 128x128x2 pixel image, which offloads the CPU. The hardware cursor mechanism can also be used to display patterns stored in the system memory. This pop-up icon is very useful to display user friendly information instantly through simple hot key operations. This advanced function combination allows significant performance increases over standard Super VGA designs and provides outstanding graphics acceleration on GUIs, such as Microsoft® Windows 98®.

Highly Integrated RAMDAC™ & Clock Synthesizer

The highly integrated design of the Apollo PLE133 Graphics Controller offers a “no TTL” solution for cost-effective, high-performance multimedia subsystem designs for the PC and compatible notebooks. The 64-bit memory data bus supporting SDRAM and SGRAM memory provides faster data transfer rates for improved system throughput. The Apollo PLE133 Graphics Controller has a built-in, high speed RAMDAC™. The RAMDAC™ is composed of one 256x24 and one 256x18 color lookup table and a triple loop frequency synthesizer, providing the read/write timing control for the Frame Buffer Memory and the refresh of the TV/CRT display.

The integrated frequency synthesizer provides a 125MHz memory clock for high speed DRAM access and a 230MHz video clock which supports various refresh rates up to 85Hz at 1280x1024.

Full Feature High Performance 3D Engine

The Apollo PLE133 Graphics Controller is equipped with an advanced Graphics Drawing, Single Cycle 3D Graphics Engine that performs premium 3D functions at a high level of more than 1M triangles per second. The 3D engine supports Microsoft® Direct3D. The 3D Engine is set up to off-load the CPU from major 3D tasks including slope calculation, sub-pixel positioning, and Tri-stripping. By balancing the 3D pipeline and reducing parameter passing, the Apollo PLE133 Graphics Controller provides very high levels of performance. The 3D engine is integrated with a triangle set-up engine that sets up triangles according to vertex input data and accomplishes various functions for 3D rendering. Gouraud shading provides smooth shading for colors across surfaces, perspective correction texture mapping to correct texture data based on the perspective, bi-linear texture filtering for interpolating, alpha blending to compensate colors for the opacity of two colors blended, Z-buffering (16-bit/24-bit), video texturing to overlay 2D video play-back onto 3D images, fogging to simulate weather effects, palletized texture mapping (1-, 4-, or 8-bit) for memory and bandwidth reduction, and anti-aliasing to reduce or eliminate jaggies resulted from alias rendering. The 3D engine also works with the APM system, conserving power while 3D operations are suspended.

Video Processor

Video processor features include: on-chip hardware Color Space Conversion (CSC) for faster data conversion on the fly, Horizontal/Vertical (H/V) scaling with interpolation, edge recovery algorithm logic, gamma correction, and overlay control with different color depths from graphics. The Apollo PLE133 Graphics Controller also includes a fully integrated GUI accelerator, read cache, and command FIFO that optimize memory bandwidth and maximize graphics performance.

The Apollo PLE133 Graphics Controller, with an integrated Video Display and a Capture Engine, supports dual apertures on the PCI bus which enables independent graphic and video data to be transported simultaneously to and from different memory areas and greatly accelerates the performance of both DirectDraw™ and DirectVideo™. The Apollo PLE133 Graphics Controller can provide dual video windows that display different images from different video sources (from the PCI bus and from the capture port) on the same screen. The video image is stored in off-screen memory and is retrieved by the Video Display Processing block for video processing. With the help of DirectDraw™ acceleration for sprites, page flipping, double buffering, and color keying, video processing is performed by utilizing a proprietary edge recovery algorithm for sharper line visibility, de-interlacing, anti-tearing, multitap horizontal filtering, dithering, and scaling operations with bilinear interpolation in both horizontal and vertical directions. Linear scaling permits zoom in/out to any size without any restrictions. In addition, the on-chip hardware Color Space Conversion (CSC) accelerates conversion for 16 bit YUV pixels into linear true color 32 bit RGB pixels on the fly. The additional X and Y minifiers are capable of shrinking video images to any linear fractions, which saves bus bandwidth and memory space. The YUV planar logic of the Apollo PLE133 Graphics Controller supports a YUV 420 format that can eliminate redundant video stream decoding procedures. The load of the CPU is reduced while performing software MPEG or software video conferencing. The color and luminance control provided by the Apollo PLE133 Graphics Controller offers color compensations to prevent color distortion for display devices such as a CRT or TV with Gamma correction and hue adjustment control.

The Video Conferencing feature allows remote and local video images to be displayed simultaneously on the same screen.

Video Capture and DVD

The Apollo PLE133 Graphics Controller has a Video Module Interface (VMI) and advanced hardware interface logic allowing it to be directly connected to many MPEG and video decoders such as the C-Cube CL450/480, SGS 3400/3500, Philips 7110/1 and Brooktree BT819/817/827/829.

The Apollo PLE133 Graphics Controller, integrated with a DVD video hardware block for motion compensation, gives existing PCs the ability to play DVD video in MPEG-2 format at high bandwidths with very good video quality.

A new industry standard is being set for transmission of non-video data over a TV broadcast signal during vertical blanking dead time. This technology is referred to as Intercast. The Apollo PLE133 Graphics Controller has the ability to take the entire video stream over the video port, sending the visible video stream to the display memory for display in a window, stripping the VBI data from the stream, and then sending this data to the CPU for processing using PCI Bus Mastering.

Versatile Frame Buffer Interface

The Apollo PLE133 Graphics Controller features a versatile frame buffer interface aperture into main system memory. Optimized performance can be achieved with the single cycle memory bus interface using programmable DRAM timing. The display queue has been increased to reduce the frequency of memory bus requests, optimizing memory bus efficiency for the graphic controller.

With the support of the internal AGP aperture, the Apollo PLE133 Graphics Controller has access to system memory through the GART. In the execute mode, the Apollo PLE133 Graphics Controller is able to use both the dedicated graphics portion and the general portion of system memory for graphics operations. As a result, DVD and 3D rendering performance and quality are greatly enhanced.

Hi-Res and Hi-Ref Display Support

Apollo PLE133 Graphics Controller display enhancements dramatically improve CRT resolution. These enhancements include support of non-interlaced 1280x1024x64K, 1024x768x16M, 800x600x16M, and 640x480x16M colors for “full spectrum” color. Extended text modes of 80 or 132 columns by 25, 30, 43, or 60 rows provide an extended graphics area frequently used in many spreadsheet and database applications. Extended graphics and text modes are supported by software drivers that provide a “ready-to-go” solution, minimizing the need for additional driver development.

A virtual screen can be created with the Apollo PLE133 Graphics Controller. When this function is enabled, a selected portion of a large image can be shown on a smaller display. The image can also be moved across the whole screen, either up or down.

The Apollo PLE133 Graphics Controller is able to automatically detect DDC monitors with I²C signaling.

CRT Power Management (VESA DPMS)

The Apollo PLE133 Graphics Controller conforms to the standard power management schemes defined by VESA™ for CRTs. The Apollo PLE133 Graphics Controller supports four states of VESA™ Display Power Management Signaling (DPMS), which decrease monitor power consumption after timeout periods. VESA™ DPMS power down states (ready, standby, suspend, and off) specify HSYNC and VSYNC signals to control the monitor power down state.

Flat Panel Monitor Interface

The Apollo PLE133 Flat Panel Monitor interface is designed to support industry standard TFT panel based Flat Panel Monitors via external TMDS transmitters. The interface supports both 18-bit and 24-bit display modes. Optionally, an 18+18 panel can be supported utilizing external latches.

Video Capture Interface

The Video Module Interface (VMI) is supported for video devices such as MPEG1 and MPEG2. Additionally, the zero-wait state host write buffer, read cache, and memory mapped I/O increase operating speeds and contribute to peak performance levels. All I/O interfaces are 5V tolerant, capable of interfacing with external devices operating at 5V, even though the Apollo PLE133 Graphics Controller runs at 2.5V. Graphics system throughput is further enhanced by a command FIFO, allowing maximum bus transfer speed for applications such as Windows™ or AutoCAD™ that directly access video memory.

Complete Hardware Compatibility

The Apollo PLE133 Graphics Controller is fully compliant with the VESA™ DDC and VAFC standards. The Apollo PLE133 Graphics Controller is 100% VGA compatible at both the BIOS and Driver level, allowing full compatibility with virtually any VGA application software. The Apollo PLE133 Graphics Controller provides hardware support to DirectDraw™, offering high speed game graphics on Windows 98®. The Apollo PLE133 Graphics Controller meets the requirements of PC99 as well, supporting a unique ID for each customer and a unique ID for each model.

Pin Descriptions
Table 1. VT8601A Pin Descriptions

CPU Interface																					
Signal Name	Pin #	I/O	Signal Description																		
HA[31:3]#	see pin list	IO	Host Address Bus. Connect to the address bus of the host CPU. These pins are inputs during CPU cycles, but are driven by the VT8601A during cache snooping operations.																		
HD[63:0]#	see pin list	IO	Host CPU Data. These signals are connected to the CPU data bus.																		
ADS#	J24	IO	Address Strobe. The CPU asserts ADS# in T1 of the CPU bus cycle.																		
BNR#	D26	IO	Block Next Request. Used to block the current request bus owner from issuing new requests. This signal is used to dynamically control the processor bus pipeline depth.																		
BPRI#	E26	IO	Priority Agent Bus Request. The owner of this signal will always be the next bus owner. This signal has priority over symmetric bus requests and causes the current symmetric owner to stop issuing new transactions unless the HLOCK# signal is asserted. The VT82C693 drives this signal to gain control of the processor bus.																		
DBSY#	H26	IO	Data Bus Busy. Used by the data bus owner to hold the data bus for transfers requiring more than one cycle.																		
DEFER#	F26	IO	Defer. The VT8601A uses a dynamic deferring policy to optimize system performance. The VT8601A also uses the DEFER# signal to indicate a processor retry response.																		
DRDY#	J23	IO	Data Ready. Asserted for each cycle that data is transferred.																		
HIT#	G24	IO	Hit. Indicates that a caching agent holds an unmodified version of the requested line. Also driven in conjunction with HITM# by the target to extend the snoop window.																		
HITM#	G26	I	Hit Modified. Asserted by the CPU to indicate that the address presented with the last assertion of EADS# is modified in the L1 cache and needs to be written back.																		
HLOCK#	G23	I	Host Lock. All CPU cycles sampled with the assertion of HLOCK# and ADS# until the negation of HLOCK# must be atomic.																		
BREQ0#	J25	O	Bus Request 0. Bus request output to CPU.																		
HREQ[4:0]#	E25, F25, F24, F23, E24	IO	Request Command. Asserted during both clocks of the request phase. In the first clock, the signals define the transaction type to a level of detail that is sufficient to begin a snoop request. In the second clock, the signals carry additional information to define the complete transaction type.																		
HTRDY#	G25	IO	Host Target Ready. Indicates that the target of the processor transaction is able to enter the data transfer phase.																		
RS[2:0]#	H25, K23, H23	IO	Response Signals. Indicates the type of response per the table below: <table style="margin-left: 20px; border: none;"> <thead> <tr> <th>RS[2:0]#</th> <th>Response type</th> </tr> </thead> <tbody> <tr><td>000</td><td>Idle State</td></tr> <tr><td>001</td><td>Retry Response</td></tr> <tr><td>010</td><td>Defer Response</td></tr> <tr><td>011</td><td>Reserved</td></tr> <tr><td>100</td><td>Hard Failure</td></tr> <tr><td>101</td><td>Normal Without Data</td></tr> <tr><td>110</td><td>Implicit Writeback</td></tr> <tr><td>111</td><td>Normal With Data</td></tr> </tbody> </table>	RS[2:0]#	Response type	000	Idle State	001	Retry Response	010	Defer Response	011	Reserved	100	Hard Failure	101	Normal Without Data	110	Implicit Writeback	111	Normal With Data
RS[2:0]#	Response type																				
000	Idle State																				
001	Retry Response																				
010	Defer Response																				
011	Reserved																				
100	Hard Failure																				
101	Normal Without Data																				
110	Implicit Writeback																				
111	Normal With Data																				
CPURST#	A19	O	CPU Reset. Reset output to CPU																		
CPURSTD#	E22	O	CPU Reset Delayed. CPU Reset output delayed by 2T.																		

DRAM Interface			
Signal Name	Pin #	I/O	Signal Description
MD[63:0]	see pin list	IO	Memory Data.
MA[14:0] / Strap Options	AF25, AE25, AE24, AD24, AE26, AD25, AD26, AC24, AC25, AC26, AB24, AB25, AB26, AB23, AA23	O / I	Memory Address. DRAM address lines. These pins are also used for power-up strapping options (sampled on the rising edge of RESET#): MA14,12 Rx68[1-0] CPU FSB Freq (0=66, 1=100, 2=rsvd, 3=133) MA13 Rx52[7] GTL I/O Buffer Pullup (L=Enable, H=Disable) MA11 Rx50[7] In-Order Queue Depth (L=4-level, H=1-level) MA10-9 North Bridge Clock Delay (0-3 Clocks) MA8, 2 Graphics Clock Select (0=Normal, 1-3=Test) MA7 Graphics Test Mode (L=Normal, H=Test) MA1-0 Graphics Clock Delay (0-3 Clocks) All pins have internal pull-downs for default low (L). Strap high (H) using 4.7K Ω TO VCC3.
CKE5# / SRASB#, CKE4# / SRASC#, CKE3# / SCASB#, CKE2# / SWEB#, CKE1# / SCASC#, CKE0# / SWEC#	AA25, AA26, V25, U25, V24, U26	IO	SDRAM Clock Enable. Clock enables 5-0 may be connected to the DRAM modules in any order. Each DRAM module requires 2 clock enables. <u>Note: These pins are powered by VSUS</u>
CS[5-0]#	W21, Y22, Y23, Y24, Y25, Y26	O	Chip Select. One per bank (<u>powered by VSUS</u>)
DQM[7:0]	AF23, AD23, W25, W26, AE23, AF24, W23, V23	O	Data Mask. One per byte lane (<u>powered by VSUS</u>)
SRASA#, SRASB# / CKE5, SRASC# / CKE4	AA24, AA25, AA26	O	Row Address Command Indicator. For support of up to three Synchronous DRAM DIMM slots (these are copies of the same logical signal). "A" controls banks 0-1 (module 0), "B" controls banks 2-3 (module 1), and "C" controls banks 4-5 (module 2).
SCASA#, SCASB# / CKE3 SCASC# / CKE1	U22, V25, V24	O	Column Address Command Indicator. For support of up to three Synchronous DRAM DIMM slots (these are copies of the same logical signal). "A" controls banks 0-1 (module 0), "B" controls banks 2-3 (module 1), and "C" controls banks 4-5 (module 2).
SWEA#, SWEB# / CKE2, SWEC# / CKE0	U24, U25, U26	O	Write Enable Command Indicator. For support of up to three Synchronous DRAM DIMM slots (these are copies of the same logical signal). "A" controls banks 0-1 (module 0), "B" controls banks 2-3 (module 1), and "C" controls banks 4-5 (module 2). <u>Note: These pins are powered by VSUS.</u>

Note: Clocking of the memory subsystem uses memory clock (MCLK); see the clock pin group at the end of the pin descriptions section for descriptions of the clock pins.

Note: Connect all memory interface pins except MD to the DRAM modules through 22 Ω series resistors (see the Apollo PLE133 Design Guide" for more specific connection details and PCB layout recommendations).

PCI Bus Interface			
Signal Name	Pin #	I/O	Signal Description
AD[31:0]	see pin list	IO	Address/Data Bus. The standard PCI address and data lines. The address is driven with FRAME# assertion and data is driven or received in following cycles.
CBE[3:0]#	AD7, AD9, AB11, AF12	IO	Command/Byte Enables. Commands are driven with FRAME# assertion. Byte enables corresponding to supplied or requested data are driven on following clocks.
PAR	AB10	IO	Parity. A single parity bit is provided over AD[31:0] and C/BE[3:0].
FRAME#	AE9	IO	Frame. Assertion indicates the address phase of a PCI transfer. Negation indicates that one more data transfer is desired by the cycle initiator. 10K Ω pullup to VCC3.
IRDY#	AC10	IO	Initiator Ready. Asserted when initiator is ready for data transfer. 10K Ω pullup to VCC3.
TRDY#	AD10	IO	Target Ready. Asserted when target is ready for data transfer. 10K Ω pullup to VCC3.
STOP#	AE10	IO	Stop. Asserted by the target to request the master to stop the current transaction. 10K Ω pullup to VCC3.
DEVSEL#	AB9	IO	Device Select. This signal is driven by the PLE133 when a PCI initiator is attempting to access main memory. It is an input when the PLE133 is acting as a PCI initiator. 10K Ω pullup to VCC3.
LOCK#	AE5	IO	Lock. Used to establish, maintain, and release resource lock. 10K Ω pullup to VCC3.
SERR#	AF10	IO	System Error. The PLE133 will pulse this signal when it detects a system error condition (10K Ω pullup to VCC3).
PREQ#	AC15	I	South Bridge Request. This signal comes from the South Bridge. PREQ# is the South Bridge request for the PCI bus. 10K Ω pullup to VCC3.
PGNT#	AD15	O	South Bridge Grant. This signal driven by the PLE133 to grant PCI access to the South Bridge. 10K Ω pullup to VCC3.
REQ[7:0]#	AD1, AC3, AC2, AF2, AD4, AE4, AD5, AC5	I	PCI Master Request. PCI master requests for use of the PCI bus. 2.2K Ω pullup to VCC5.
GNT[7:0]#	AE1, AD3, AD2, AE2, AE3, AF3, AF4, AB5	O	PCI Master Grant. Permission is given to the master to use the PCI bus. 2.2K Ω pullup to VCC3.
INTA#	W5	O	PCI Interrupt Out. INTA# is an asynchronous active low output used to signal an event that requires handling. It is driven by the integrated graphics controller.

Note: Clocking of the PCI interface is performed with PCLK; see the clock pin group at the end of the pin descriptions section for descriptions of the clock input pins.

Clock / Reset Control			
<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>
HCLK	G22	I	Host Clock. This pin receives the host CPU clock. This clock is used by all logic in the host CPU domain. It is driven by the external clock synthesizer.
MCLKI	K22	I	Memory Clock In. This clock is used by internal clock logic to maintain the proper phase relationship with MCLKO. It is driven by the external clock synthesizer.
MCLKO	J22	O	Memory Clock Out. Created on-chip from MCLKI and used by the memory controller as a timing reference for creation of all memory timing sequences. It is connected to the external clock chip for use in maintaining proper phase relationships.
PCLK	AB15	I	PCI Clock. This clock is used by all on-chip logic in the PCI clock domain. This input must be 33 MHz maximum to comply with PCI specification requirements and must be synchronous with the host CPU clock (HCLK) with an HCLK:PCLK frequency ratio of 2:1 (66MHz CPU clock) or 3:1 (100 MHz CPU clock). The PCI clock needs to be controlled to within 1.5 ± 0.5 nsec relative to the host CPU clock (CPU leads).
PCKRUN#	AF15	IO	PCI Clock Run. For implementation of PCI bus clock control for low-power PCI bus operation. Refer to the "PCI Mobile Design Guidelines" and "Apollo PLE133 Design Guide" documents for additional information.
XLTI	Y4	I	Crystal Input. 14.31818 MHz for the video clock synthesizer reference. Connect to a 14.31818 MHz clock source if a crystal not used. Connect to main ground plane GND with 10Pf if using a crystal.
XLTO	W4	O	Crystal Output. 14.31818 MHz for the video clock synthesizer reference. Leave open if a clock source is used instead of a crystal. Connect to main ground plane GND with 10Pf if using a crystal.
RESET#	AE15	I	Reset. Driven from the South Bridge PCIRST# signal. When asserted (low), this signal resets the PLE133 and sets all register bits to the default value. This signal also connects to the PCI bus (South Bridge RESET drives the ISA bus if implemented). The rising edge of this signal is used to sample all power-up strap options (see memory interface MA pins).
CPURST#	A19	O	CPU Reset. CPU Reset output to the host CPU.
CPURSTD#	E22	O	CPU Reset Delayed 2T. Alternate CPU Reset output to the host CPU
PWROK	AD14	I	Power OK. Connect to South Bridge and Power Good circuitry.
SUST#	AC22	I	Suspend Status. For implementation of the Suspend-to-DRAM feature. <u>Input logic for this pin is powered by VSUS.</u> Connect to the South Bridge SUST# pin or to a 10K Ω pullup to VSUS if not used.
SUSP	F5	I	Suspend. Used to put the integrated graphics controller into suspend state. <u>Input logic for this pin is powered by VCC3.</u> Connect to South Bridge GPO pin or to a 10K Ω pullup to VCC3 if not used.

Miscellaneous			
<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>
ETST#	F4	I	Test Mode Enable. 4.7K Ω pullup to VCC3 for normal operation.
IMIO	M2	O	IMI Out. Leave open.
IMIIN	M3	I	IMI In. 4.7K Ω pullup to VCC3.

CRT Interface			
Signal Name	Pin #	I/O	Signal Description
RED	C2	A	Red. Red analog output to the CRT. Connect 75Ω load resistor to GNDR (RGB Return) and connect to VGA connector through a series ferrite bead and 10pF capacitors to GNDR on both input and output sides of the bead (see “Apollo PLE133 Design Guide”).
GRN	D3	A	Green. Green analog output to the CRT. Connect same as RED.
BLUE	D2	A	Blue. Blue analog output to the CRT. Connect same as RED.
HSYNC	E2	O	Horizontal Sync. Digital horizontal sync output to the CRT. Also used (with VSYNC) to signal power management state information to the CRT per the VESA™ DPMS™ standard. Connect to VGA connector through a series 47Ω resistor and 120pF capacitor to ground (see “Apollo PLE133 Design Guide”).
VSYNC	E1	O	Vertical Sync. Digital vertical sync output to the CRT. Also used (with HSYNC) to signal power management state information to the CRT per the VESA™ DPMS™ standard. Connect to VGA connector through a series 47Ω resistor and 120pF capacitor to ground (see “Apollo PLE133 Design Guide”).
SDA	F2	IO	DDC Data/Address. Serial I ² C protocol for VESA™ DDC2B signaling to the CRT. Connect this pin to VCC5 through a 4.7KΩ pullup. Connect to the VGA connector only (pin 12 of the connector). Connect through a ferrite bead and 120pF capacitor to ground (on the output side of the bead). Refer to the “Apollo PLE133 Design Guide” for additional information.
SCL	F3	IO	DDC Clock. Serial I ² C protocol for VESA™ DDC2B signaling to the CRT. Connect this pin to VCC5 through a 4.7KΩ pullup. Connect to the VGA connector only (pin 15 of the VGA connector). Connect through a ferrite bead and 120pF capacitor to ground (on the output side of the bead). Refer to the “Apollo PLE133 Design Guide” for additional information.

DFP Interface			
Signal Name	Pin #	I/O	Signal Description
PD[23-0]	(see pin list)	O	Panel Data. Digital pixel data outputs to the panel.
SCLK	G4	O	Shift Clock. Clock for transferring digital pixel data.
DE	H3	O	Data Enable. Indicates valid data on PD[23-0].
LP	G5	O	Line Pulse. Digital monitor equivalent of HSYNC.
FLM	G3	O	First Line Marker. Digital monitor equivalent of VSYNC.
EVDD	F1	O	Enable Panel VDD Power.
EVEE	H5	O	Enable Panel VEE Power.
EBLT	G1	O	Enable Panel Backlight.

Note: Connect SHFCLK, DE, LP, and FLM to external TMDS transmitters through series 22Ω resistors. See the “Apollo PLE133 Design Guide” for DFP interface design examples and additional information.

TV Input / Video Interface			
<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>
VD[15-0]	N4, N1, N2, N5, P4, P3, P2, P5, R3, R1, R4, R2, R5, T1, T2, R6	IO	Video Capture / Playback Data.
VHS	T3	IO	Video Horizontal Sync. Connect to TV decoder if used.
VVS	U1	IO	Video Vertical Sync. Connect to TV decoder if used.
VCLK	U3	IO	Video Clock. Connect to TV decoder through a series 22Ω resistor.

Note: Refer to the “Apollo PLE133 Design Guide” for video interface design examples.

TV Output Interface			
<u>Signal Name</u>	<u>Pin #</u>	<u>I/O</u>	<u>Signal Description</u>
TVD[7-0]	U2, T6, U4, T5, V3, U5, V2, V1	O	TV Output Data. Connect to TV encoder if used.
TVHS	V5	O	TV Horizontal Sync. Connect to TV encoder if used.
TVVS	W3	O	TV Vertical Sync. Connect to TV encoder if used.
TVCLK	V4	O	TV Clock. Connect to TV encoder through a series 22Ω resistor.

Note: Refer to the “Apollo PLE133 Design Guide” for TV interface design examples.

Clock Power / Ground and Filtering			
Signal Name	Pin #	I/O	Signal Description
VCCA	H21, H22	P	Power for North Bridge Clock Circuitry (2.5V \pm 5%). Connect to VCCI through a ferrite bead and decouple to GNDA with 0.001Uf and 0.1Uf ceramic and 10Uf tantalum capacitors (see "Apollo PLE133 Design Guide").
GNDA	L21, L22	P	Ground for North Bridge Clock Circuitry. Connect to main ground plane GND through a ferrite bead. (see "Apollo PLE133 Design Guide").
VCCV1	W2	P	Power for Video Clock Synthesizer 1 Analog Circuitry (2.5V \pm 5%). Connect to VCCI through a ferrite bead and decouple to GNDV1 with 0.001Uf and 0.1Uf ceramic and 10Uf tantalum capacitors (see "Apollo PLE133 Design Guide").
GNDV1	Y1	P	Ground for Video Clock Synthesizer 1. Connect to main ground plane through a ferrite bead.
VLF1	Y3	A	Low Pass Filter Capacitor for Video Clock Synthesizer 1. Connect to GNDV1 through a 560Pf capacitor.
VCCV2	Y2	P	Power for Video Clock Synthesizer 2 Analog Circuitry (2.5V \pm 5%). Connect to VCCI through a ferrite bead and decouple to GNDV2 with 0.001Uf and 0.1Uf ceramic and 10Uf tantalum capacitors (see "Apollo PLE133 Design Guide").
GNDV2	AA1	P	Ground for Video Clock Synthesizer 2. Connect to main ground plane through a ferrite bead.
VLF2	AA2	A	Low Pass Filter Capacitor for Video Clock Synthesizer 2. Connect to GNDV2 through a 560Pf capacitor.
PLLTST	K24	I	PLL Test. Pull down with 4.7K resistor for normal operation.

RAMDAC Output Power / Ground and Analog Control			
Signal Name	Pin #	I/O	Signal Description
VCCS	C1	P	Power for RAMDAC Current Source Circuitry (2.5V \pm 5%). Connect to VCCI through a ferrite bead and decouple to GNDS with 0.001uF and 0.1uF ceramic and 10uF tantalum capacitors (see "Apollo PLE133 Design Guide").
GNDS	B1	P	Ground for RAMDAC Current Source Circuitry. Connect to main ground plane through a ferrite bead.
COMP	E4	A	Compensation Capacitor. RAMDAC analog control. Connect to VCCS using a 0.1 uF capacitor.
IRSET	E3	A	RAMDAC Current Set Point Resistor. RAMDAC analog control. Connect to GNDS through a 360 Ω 1% resistor.
GNDRGB	A1	P	RGB Video Output Return. Connection point for the RGB load resistors. Also used as a shield for the RGB video output traces to the VGA display connector. Connects to RGB return pins 6, 7, and 8 of the VGA connector. Connect to main ground plane through a ferrite bead. Refer to the "Apollo PLE133 Design Guide" for more specific connection and PCB layout details.

Commonly Used Prefix / Suffix Letters in Signal Names:

I = Internal Logic	A = North Bridge Clock Synthesizer
M = Memory (SDRAM) Interface	V1 = Video Clock Synthesizer PLL1
H = Host CPU Interface	V2 = Video Clock Synthesizer PLL2
P = PCI Bus Interface	D = Video Clocks Digital Data Path
G = AGP Bus (internal in PLE133)	R = RAMDAC Digital Data Path
GM = Graphics Memory Interface	S = RAMDAC Current Source
U (or USB) = USB (Universal Serial Bus)	RGB = Analog Video Out Return
H (or HWM) = Hardware Monitoring	TV = TV Out
SUS = Suspend Power	V = TV In / Video Capture

Digital Power and Ground			
Signal Name	Pin #	I/O	Signal Description
VCC5	U6	P	Power for Display / Video Interfaces (5V ±5%). Power for CRT H/VSYNC, DFP interface, video interface, and TV interface. Used to provide adequate output voltage swing for driving external video devices. Also used to provide 5V input tolerance from those interfaces.
VCC3	F7, F10, F12, F17, F20, G6, G21, H6, K21, L4, L12, L15, M11, M16, R11, R16 , T4, T12, T15 , U21, W6, Y6, Y21, AA7, AA10, AA17, AA20	P	Power for On-Board Interfaces (3.3V ±5%). Power for host CPU / L2 Cache interface, PCI bus interface, and memory interface (except pins listed below under VSUS).
VSUS3	V22, W22, AB22	P	Suspend Power (3.3V ±5%). Power for memory interface signals SRASC#, SCASC#, SWEC#, SWEB#, RAS[5-0]#, CAS[7-0]#, and SUST#. Connect to VCC3 if suspend functions are not implemented.
VSUS2	AA22	P	Suspend Power (2.5V ±5%). Connect to VCCI if suspend functions are not implemented.
VCCI	F9, F18, J6, J21, V6, V21, AA9, AA18	P	Power for On-Chip Internal Logic (2.5V ±5%).
VCCD	W1	P	Power for Video Clock Synthesizer Digital Logic (2.5V ±5%). Connect to VCCI through a ferrite bead and decouple to main ground plane GND with 0.001uF and 0.1uF ceramic and 10uF tantalum capacitors (see "Apollo PLE133 Design Guide").
VCCR	D1	P	Power for RAMDAC Video Output Digital Logic (2.5V ±5%). Connect to VCCI through a ferrite bead and decouple to main ground plane GND with 0.001uF and 0.1uF ceramic and 10uF tantalum capacitors (see "Apollo PLE133 Design Guide").
VTT	E11, F19	P	CPU Interface Termination Voltage (1.5V ±10%).
GTLREF	E12, E21	P	CPU Interface GTL+ Voltage Reference . 2/3 VTT ±2%. Derived from the termination voltage to the pullup resistors. Determines the noise margin for the host CPU interface signals. Internally connects to the GTL ⁺ sense amp on each GTL ⁺ input or I/O pin.
GND	A9, A18, A26, B2, C8, C14, C19, D4, D23, F6, F13-F14, F16, F21, H24, J26, L11, L13, L14, L16, M12-M15 , M21, N3, N6, N11-N16 , N21, P1, P6, P11-P16 , P21, R12-R15, T11, T13, T14, T16 , T21, V26, W24, AA6, AA13-AA15, AA21, AC4, AC23, AD8, AD13, AD19, AF1, AF9, AF18, AF26	P	Ground . Connect to primary PCB ground plane.
NC	A2-A5, B3-B5, C3-C5, Y5, AA3-AA5, AB1-AB4, AC1	-	No Connect .

REGISTERS

Register Overview

The following tables summarize the configuration and I/O registers of the PLE133. These tables also document the power-on default value (“Default”) and access type (“Acc”) for each register. Access type definitions used are RW (Read/Write), RO (Read/Only), “—” for reserved / used (essentially the same as RO), and RWC (or just WC) (Read / Write 1’s to Clear individual bits). Registers indicated as RW may have some read/only bits that always read back a fixed value (usually 0 if unused); registers designated as RWC or WC may have some read-only or read write bits (see individual register descriptions following these tables for details). All offset and default values are shown in hexadecimal unless otherwise indicated.

Register Summary Tables

Table 2. Register Summary

I/O Ports

Port #	I/O Port	Default	Acc
22	PCI / AGP Arbiter Disable	00	RW
CFB-8	Configuration Address	0000 0000	RW
CFE-C	Configuration Data	0000 0000	RW

Device 0 Bus 0 Registers - Host Bridge
PCI Configuration Registers

Offset	Configuration Header	Default	Acc
1-0	Vendor ID	1106	RO
3-2	Device ID	0601	RO
5-4	Command	0006	RW
7-6	Status	0290	WC
8	Revision ID	nn	RO
9	Program Interface	00	RO

Extended Registers – Non-Indexed I/O Ports

I/O Port	Extended Non-Indexed Regs	Default	Acc
3D8	Alt Destination Segment Addr	00	RW
3D9	Alt Source Segment Address	—	RW
3xB	Alt Clock Select	—	RW

Note: 3xB notation indicates that these registers are accessible at either 3BB or 3DB depending on the setting of the color / mono bit.

Standard VGA Registers

Port	Index	VGA Registers	Default	Acc
3B4/5	0-18	CRT Controller (Mono Mode)	—	RW
3BA	—	Input Status 1 (Mono Mode)	—	R
3C0/1	0-14	Attribute Controller	—	RW
3C2	—	Input Status 0	—	R
3C2	—	Miscellaneous Output (Write)	—	W
3C3	—	Video Subsystem Enable	—	RW
3C4/5	0-4	Sequencer	—	RW
3C6	—	RAMDAC Pixel Mask	—	RW
3C7	—	RAMDAC Read Index	—	W
3C8	—	RAMDAC Write Index	—	W
3C8	—	RAMDAC Index Readback	—	R
3C9	0-FF	RAMDAC Palette Data	—	RW
3CC	—	Miscellaneous Output (Read)	—	R
3CE/F	0-8	Graphics Controller	—	RW
3D4/5	0-18	CRT Controller (Color Mode)	—	RW
3DA	—	Input Status 1 (Color Mode)	—	R
46E8	—	Display Adapter Enable	—	RW

Note: CRTC registers are accessible at either 3B4 / 3B5 or 3D4 / 3D5 (shorthand notation 3x4 / 3x5) depending on the setting of the color / mono bit.

Standard VGA Registers – Attribute Controller (AR)

Port	Index	Attribute Controller Regs	Default	Acc
3C0	—	Index	—	RW
3C0/1	0-F	Color Palette	—	RW
3C0/1	10	Attribute Mode Control	—	RW
3C0/1	11	Overscan Color	—	RW
3C0/1	12	Color Plane Enable	—	RW
3C0/1	13	Horizontal Pixel Panning	—	RW
3C0/1	14	Color Select	—	RW

Standard VGA Registers – Sequencer (SR)

Port	Index	Sequencer Registers	Default	Acc
3C4	—	Index	—	RW
3C5	0	Reset	—	RW
3C5	1	Clocking Mode	—	RW
3C5	2	Map Mask	—	RW
3C5	3	Character Map Select	—	RW
3C5	4	Memory Mode	—	RW

Standard VGA Registers – Graphics Controller (GR)

Port	Index	Graphics Controller Regs	Default	Acc
3CE	—	Index	—	RW
3CF	0	Set / Reset	—	RW
3CF	1	Enable Set / Reset	—	RW
3CF	2	Color Compare	—	RW

Miscellaneous I/O

One I/O port is defined in the PLE133: Port 22.

Port 22 – PCI /AGP Arbiter DisableRW

- 7-2 **Reserved** always reads 0
- 1 **AGP Arbiter Disable**
 - 0 Respond to GREQ# signaldefault
 - 1 Do not respond to GREQ# signal
- 0 **PCI Arbiter Disable**
 - 0 Respond to all REQ# signals.....default
 - 1 Do not respond to any REQ# signals, including PREQ#

This port can be enabled for read/write access by setting bit-7 of Device 0 Configuration Register 78.

Configuration Space I/O

All registers in the PLE133 (listed above) are addressed via the following configuration mechanism:

Mechanism #1

These ports respond only to double-word accesses. Byte or word accesses will be passed on unchanged.

Port CFB-CF8 - Configuration Address..... RW

- 31 **Configuration Space Enable**
 - 0 Disabled..... default
 - 1 Convert configuration data port writes to configuration cycles on the PCI bus
- 30-24 **Reserved**always reads 0
- 23-16 **PCI Bus Number**
Used to choose a specific PCI bus in the system
- 15-11 **Device Number**
Used to choose a specific device in the system (devices 0 and 1 are defined)
- 10-8 **Function Number**
Used to choose a specific function if the selected device supports multiple functions (only function 0 is defined).
- 7-2 **Register Number (also called the "Offset")**
Used to select a specific DWORD in the configuration space
- 1-0 **Fixed**always reads 0

Port CFF-CFC - Configuration Data..... RW

Refer to PCI Bus Specification Version 2.2 for further details on operation of the above configuration registers.

Register Descriptions

Device 0 Bus 0 Header Registers - Host Bridge

All registers are located in PCI configuration space. They should be programmed using PCI configuration mechanism 1 through CF8 / CFC with bus number, function number, and device number equal to zero.

Device 0 Offset 1-0 - Vendor ID.....RO

15-0 ID Code (reads 1106h to identify VIA Technologies)

Device 0 Offset 3-2 - Device ID.....RO

15-0 ID Code (reads 0601h to identify the VT8601A)

Device 0 Offset 5-4 - Command.....RW

- 15-10 Reserved** always reads 0
- 9 Fast Back-to-Back Cycle Enable** RO
 - 0 Fast back-to-back transactions only allowed to the same agent.....default
 - 1 Fast back-to-back transactions allowed to different agents
- 8 SERR# Enable**..... RO
 - 0 SERR# driver disabled.....default
 - 1 SERR# driver enabled
 (SERR# is used to report parity errors if bit-6 is set).
- 7 Address / Data Stepping**..... RO
 - 0 Device never does stepping.....default
 - 1 Device always does stepping
- 6 Parity Error Response**..... RW
 - 0 Ignore parity errors & continue.....default
 - 1 Take normal action on detected parity errors
- 5 VGA Palette Snoop**..... RO
 - 0 Treat palette accesses normally.....default
 - 1 Don't respond to palette accesses on PCI bus
- 4 Memory Write and Invalidate Command**..... RO
 - 0 Bus masters must use Mem Write.....default
 - 1 Bus masters may generate Mem Write & Inval
- 3 Special Cycle Monitoring**..... RO
 - 0 Does not monitor special cycles.....default
 - 1 Monitors special cycles
- 2 Bus Master** RO
 - 0 Never behaves as a bus master
 - 1 Can behave as a bus master.....default
- 1 Memory Space**..... RO
 - 0 Does not respond to memory space
 - 1 Responds to memory space.....default
- 0 I/O Space** RO
 - 0 Does not respond to I/O spacedefault
 - 1 Responds to I/O space

Device 0 Offset 7-6 - Status..... RWC

- 15 Detected Parity Error**
 - 0 No parity error detected..... default
 - 1 Error detected in either address or data phase. This bit is set even if error response is disabled (command register bit-6). write one to clear
- 14 Signaled System Error (SERR# Asserted)** always reads 0
- 13 Signaled Master Abort**
 - 0 No abort received default
 - 1 Transaction aborted by the master write one to clear
- 12 Received Target Abort**
 - 0 No abort received default
 - 1 Transaction aborted by the target write 1 to clear
- 11 Signaled Target Abort** always reads 0
 - 0 Target Abort never signaled
- 10-9 DEVSEL# Timing**
 - 00 Fast
 - 01 Medium always reads 01
 - 10 Slow
 - 11 Reserved
- 8 Data Parity Error Detected**
 - 0 No data parity error detected default
 - 1 Error detected in data phase. Set only if error response enabled via command bit-6 = 1 and VT8601A was initiator of the operation in which the error occurred..... write one to clear
- 7 Fast Back-to-Back Capable** always reads 1
- 6 Reserved** always reads 0
- 5 66MHz Capable**..... always reads 0
- 4 Supports New Capability list**..... always reads 1
- 3-0 Reserved** always reads 0

Device 0 Offset 8 - Revision ID..... RO

7-0 VT8601A Chip Revision Code

Device 0 Offset 9 - Programming Interface..... RO

7-0 Interface Identifier always reads 00

Device 0 Offset A - Sub Class Code..... RO

7-0 Sub Class Code.....reads 00 to indicate Host Bridge

Device 0 Offset B - Base Class Code..... RO

7-0 Base Class Code..reads 06 to indicate Bridge Device

Device 0 Offset D - Latency Timer..... RW

Specifies the latency timer value in PCI bus clocks.

- 7-3 Guaranteed Time Slice for CPU** default=0
- 2-0 Reserved** (fixed granularity of 8 clks) .. always read 0
Bits 2-1 are writeable but read 0 for PCI specification compatibility. The programmed value may be read back in Offset 75 bits 5-4 (PCI Arbitration 1).

Device 0 Offset E - Header Type.....RO

7-0 Header Type Code reads 00: single function

Device 0 Offset F - Built In Self Test (BIST).....RO

7 BIST Supportedreads 0: no supported functions

6-0 Reserved always reads 0

Device 0 Offset 13-10 - Graphics Aperture Base.....RW

31-28 Upper Programmable Base Address Bits def=0

27-20 Lower Programmable Base Address Bits def=0

These bits behave as if hardwired to 0 if the corresponding Graphics Aperture Size register bit (Device 1 Offset 84h) is 0.

27	26	25	24	23	22	21	20	(This Register)
7	6	5	4	3	2	1	0	(Gr Aper Size)
RW	RW	RW	RW	RW	RW	RW	RW	1M
RW	RW	RW	RW	RW	RW	RW	0	2M
RW	RW	RW	RW	RW	RW	0	0	4M
RW	RW	RW	RW	RW	0	0	0	8M

RW	0	0	0	0	0	0	0	128M
0	0	0	0	0	0	0	0	256M

19-0 Reserved always reads 00008

Note: The locations in the address range defined by this register are prefetchable.

Device 0 Offset 2D-2C – Subsystem Vendor ID..... RW

15-0 Subsystem Vendor ID default = 0000

Device 0 Offset 2F-2E – Subsystem ID RW

15-0 Subsystem ID default = 0000

Device 0 Offset 37-34 - Capability Pointer RO

Contains an offset from the start of configuration space.

31-0 AGP Capability List Pointeralways reads A0h

Device 0 Bus 0 Host Bridge Registers

CPU Interface Control

Device 0 Offset 50 – Request Phase Control (02h) RW

- 7 **CPU Hardwired IOQ (In Order Queue) Size**
Default per the inverse of the strap on pin MA11 during reset. This register bit can be written to 0 to restrict the chip to one level of IOQ.
0 1-Level
1 4-Level . **default if no external strap resistor**
- 6 **Read-Around-Write**
0 Disabledefault
1 Enable
- 5 **Reserved** always reads 0
- 4 **Defer Retry When HLOCK Active**
0 Disabledefault
1 Enable
Note: always set this bit to 1
- 3-2 **Reserved** always reads 0
- 1 **Fast Speculative Read**
0 Disable
1 Enabledefault
- 0 **CPU / PCI Master Read DRAM Timing**
0 Start DRAM read after snoop complete.....def
1 Start DRAM read before snoop complete

Device 0 Offset 51 – Response Phase Control (02h) RW

- 7 **CPU Read DRAM 0WS for Back-to-Back Read Transactions**
0 Disable..... default
1 Enable
Setting this bit enables maximum read performance by allowing continuous 0-wait-state reads for pipelined line reads. If this bit is not set, there will be at least 1T idle time between read transactions.
- 6 **CPU Write DRAM 0WS for Back-to-Back Write Transactions**
0 Disable..... default
1 Enable
Setting this bit enables maximum write performance by allowing continuous 0-wait-state writes for pipelined line writes and sustained 3T single writes. If this bit is not set, there will be at least 1T idle time between write transactions.
- 5 **DRAM Read Request Rate**
0 3T default
1 2T
- 4 **Fast Response (HIT/HITM Sampled 1T Earlier)**
0 Disable..... default
1 Enable
- 3 **Non-Posted IOW**
0 Disable..... default
1 Enable
- 2 **CPU Read DRAM Prefetch Buffer Depth**
0 1-level prefetch buffer default
1 4-level prefetch buffer
- 1 **CPU-to-DRAM Post-Write Buffer Depth**
0 1-level post-write buffer
1 4-level post-write buffer default
- 0 **Concurrent PCI Master / Host Operation**
0 Disable – the CPU bus will be occupied (BPRI asserted) during the entire PCI operation def
1 Enable – the CPU bus is only requested before ADS# assertion

Device 0 Offset 52 – Dynamic Defer Timer (10h).....RW

- 7 **GTL I/O Buffer Pullup**.....default = MA13 Strap
 - 0 Disable
 - 1 Enable
 The default value of this bit is determined by a strap on the MA13 pin during reset.
- 6 **RAW Write Retire After 2 Writes**
 - 0 Disabledefault
 - 1 Enable
- 5 **Reserved** always reads 0
- 4-0 **Snoop Stall Count**
 - 00 Disable dynamic defer
 - 01-1F Snoop stall count default = 10h

Device 0 Offset 53 – Miscellaneous (00h)..... RW

- 7 **HREQ Function**
 - 0 Disable..... default
 - 1 Enable
- 6 **DRAM Frequency Higher Than CPU FSB**
 - 0 Disable..... default
 - 1 Enable
 Setting this bit enables the DRAM subsystem to run at a higher frequency than the CPU FSB frequency. When setting this bit, register bit Rx69[6] must also be set and only SDRAM memory type DIMM modules may be installed. An EDO / SDRAM mix in the DRAM subsystem is not supported in this case.
- 5 **AGP/PCI-to-CPU Master / CPU-to-PCI Slave Concurrency**
 - 0 Disable..... default
 - 1 Enable
- 4 **HPRI Function**
 - 0 Disable..... default
 - 1 Enable
- 3 **P6Lock Function**
 - 0 Disable..... default
 - 1 Enable
- 2 **P6Lock**
 - 0 Disable..... default
 - 1 Enable
- 1-0 **Reserved**always reads 0

 - 101 1M (Base Address A16-19 must be 0)
 - 110 2M (Base Address A16-20 must be 0)
 - 111 4M (Base Address A16-21 must be 0)

DRAM Control

These registers are normally set at system initialization time and not accessed after that during normal system operation. Some of these registers, however, may need to be programmed using specific sequences during power-up initialization to properly detect the type and size of installed memory (refer to the VIA Technologies VT8601A BIOS porting guide for details).

Table 3. System Memory Map

Space	Start	Size	Address Range	Comment

 - 01 512K-640K
 - 10 15M-16M (1M)
 - 11 14M-16M (2M)
- 1-0 SMI Mapping Control**
 - 00 Disable SMI Address Redirection..... default
 - 01 Allow access to DRAM Axxxx-Bxxxx for both normal and SMI cycles
 - 10 Reserved
 - 11 Allow SMI Axxxx-Bxxxx DRAM access

Note: The A0000-BFFFF address range is reserved for use by VGA controllers for system access to the VGA frame buffer. Since frame buffer accesses are normally directed to the system VGA controller (with its separate memory subsystem), system DRAM locations in the A0000-BFFFF range would normally be unused. Setting the above bits appropriately allows this block of system memory to be used by directing Axxxx-Bxxxx accesses to corresponding memory addresses in system DRAM instead of directing those accesses to the PCI bus for VGA frame buffer access.

Device 0 Offset 64 - DRAM Timing for Banks 0,1RW

Device 0 Offset 65 - DRAM Timing for Banks 2,3RW

Device 0 Offset 66 - DRAM Timing for Banks 4,5RW

Settings for Registers 64-66

 - 11 Reserved
- 3 Reserved (Do Not Program)..... default = 0**
- 2 ACTIVE Command to CMD Command Period**
 - 0 2T
 - 1 3Tdefault
- 1-0 Bank Interleave**
 - 00 No Interleave.....default
 - 01 2-way
 - 10 4-way
 - 11 Reserved

Device 0 Offset 68 - DRAM Control RW

- 7 Reserved (Do Not Program) default = 0**
- 6 Bank Page Control**
 - 0 Allow only pages of the same bank active .. def
 - 1 Allow pages of different banks to be active
- 5 Reserved (Do Not Program) default = 0**
- 4 Internal Graphics Controller Frequency**
 - 0 66 / 100 MHz..... default
 - 1 133 MHz

This bit must be set to 1 if the DRAM frequency is 133 MHz. If the DRAM frequency is set to 100 or 66 MHz this bit is ignored. (see also table under Rx69[7-6]).
- 3 Reserved (Do Not Program)..... default = 0**
- 2 Burst Refresh**
 - 0 Disable..... default
 - 1 Enable (burst 4 times)
- 1-0 System Frequency Divider.....RO**
 - 00 CPU / PCI Frequency Ratio = 2x (66 MHz)
 - 01 CPU / PCI Frequency Ratio = 3x (100 MHz)
 - 10 -reserved-
 - 11 CPU / PCI Frequency Ratio = 4x (133 MHz)

These bits are latched from MA[14, 12] at the rising edge of RESET#. Without external strapping resistors, the default setting of these bits is 00 (66 MHz).

Device 0 Offset 69 – DRAM Clock Select (00h).....RW

7-6	DRAM Operating Frequency Select			RW
	<u>Rx68[1-0]</u>	<u>Rx69[7-6]</u>	<u>Rx68[4]</u>	<u>CPU/DRAM/VGA</u>
	00	00	x	66/66/66 (default)
	00	01	x	66/100/100
	01	00	x	100/100/100
	01	10	x	100/66/66
	01	01	1	100/133/133
	10	00	1	133/133/133
	10	10	x	133/100/100

All other combinations are reserved. The internal graphics controller runs synchronous to the DRAM and at the same frequency (if the DRAM controller frequency is set to 133, Rx68[4] must also be set to 1).

- 5 256M bit DRAM Support**
 - 0 Disabledefault
 - 1 Enable (DCLKRD becomes output)
- 4 DRAM Controller Command Register Output**

 - 1 More slew rate control
- 2 CAS Second Level Strength Control**
 - 0 Normal slew rate control default
 - 1 More slew rate control
- 1 Reserved (Do Not Program)..... default = 0**
- 0 Multi-Page Open**
 - 0 Disable (page registers marked invalid and no page register update which causes non page-mode operation)
 - 1 Enable..... default

Device 0 Offset 6C - SDRAM Control.....RW

- 7-5 **Reserved** always reads 0
- 4 **CKE Configuration**
 - 0 RASA = CSA, RASB = CSB, CKE0=CKE0, CKE1 = CKE1
 - 1 RASA = CSA, RASB = CSB, CKE3-2 = CSA7-6, CKE5-4 = CSB7-6, CKE1 = GCKE (Global CKE), CKE0 = FENA (FET Enable)
- 3 **Fast AGP TLB lookup**
 - 0 Disable default
 - 1 Reduce the lookup time from 4T to 2T
- 2-0 **SDRAM Operation Mode Select**
 - 000 Normal SDRAM Mode default
 - 001 NOP Command Enable
 - 010 All-Banks-Precharge Command Enable (CPU-to-DRAM cycles are converted to All-Banks-Precharge commands).
 - 011 MSR Enable
CPU-to-DRAM cycles are converted to commands and the commands are driven on MA[13:0]. The BIOS selects an appropriate host address for each row of memory such that the right commands are generated on MA[13:0].
 - 100 CBR Cycle Enable (if this code is selected, CAS-before-RAS refresh is used; if it is not selected, RAS-Only refresh is used)
 - 101 Reserved
 - 11x Reserved

Device 0 Offset 6D - DRAM Drive Strength..... RW

- 7 **Reserved** always reads 0
- 6-5 **Delay DRAM Read Latch**
 - 00 Disable default
 - 01 0.5 ns
 - 10 1.0 ns
 - 11 1.5 ns
- 4 **MD Drive**
 - 0 6 mA default
 - 1 8 mA
- 3 **SDRAM Command Drive Strength (SRAS#, SCAS#, SWE#)**
 - 0 16mA default
 - 1 24mA
- 2 **MA[2:13] / WE# Drive Strength**
 - 0 16mA default
 - 1 24mA
- 1 **CAS# Drive Strength**
 - 0 8 mA default
 - 1 12 mA
- 0 **RAS# Drive Strength**
 - 0 16mA default
 - 1 24mA

Rx6B[0]	Rx64-66[1-0]	Rx68[7-6]	Remark
0	00	00	Non-page mode, every access starts from precharge-active cmd
1	00	00	Only one page active at a time (recommended setting)
1	01 or 10	00	Only allow sub-bank of a SDRAM bank active at a time, # of subbank depends on Rx64-66<1:0>
1	01 or 10	01	Allow mutiple sub-banks across different SDRAM banks active, but if EDO is accessed, all SDRAM pages will be closed
1	01 or 10	11	Allow maximum 8 pages of SDRAM, EDO opened

PCI Bus Control

These registers are normally programmed once at system initialization time.

Device 0 Offset 70 - PCI Buffer ControlRW

- 7 CPU to PCI Post-Write**
 - 0 Disabledefault
 - 1 Enable
- 6 PCI Master to DRAM Post-Write**
 - 0 Disabledefault
 - 1 Enable
- 5 Reserved**
- 4 PCI Master to DRAM Prefetch Disable**
 - 0 Enabledefault
 - 1 Disable
- 3 CPU-to-PCI Buffer Available Cycle Reduction**

- 7 CPU-to-PCI Post-Write Retry Failed**
 - 0 Continue retry attempt..... default
 - 1 Go to arbitration
- 6 CPU Latency Timer Bit-0.....RO**
 - 0 CPU has at least 1 PCLK time slot when CPU has PCI bus..... default
 - 1 CPU has no time slot
- 5-4 Master Priority Rotation Control**
 - 00 Disabled (arbitration per Rx75 bit-7) default
 - 01 Grant to CPU after every PCI master grant
 - 10 Grant to CPU after every 2 PCI master grants
 - 11 Grant to CPU after every 3 PCI master grants

With setting 01, the CPU will always be granted access after the current bus master completes, no matter how many PCI masters are requesting. With setting 10, if other PCI masters are requesting during the current PCI master grant, the highest priority master will get the bus after the current master completes, but the CPU will be guaranteed to get the bus after that master completes. With setting 11, if other PCI masters are requesting, the highest priority will get the bus next, then the next highest priority will get the bus, then the CPU will get the bus. In other words, with the above settings, even if multiple PCI masters are continuously requesting the bus, the CPU is guaranteed to get access after every master grant (01), after every other master grant (10) or after every third master grant (11).
- 3-2 High Priority REQ Select**
 - 00 REQ4 default
 - 01 REQ0
 - 10 REQ1
 - 11 REQ2

GART / Graphics Aperture Control

The function of the Graphics Address Relocation Table (GART) is to translate virtual 32-bit addresses issued by an AGP device into 4K-page based physical addresses for system memory access. In this translation, the upper 20 bits (A31-A12) are remapped, while the lower 12 address bits (A11-A0) are used unchanged.

A one-level fully associative lookup scheme is used to implement the address translation. In this scheme, the upper 20 bits of the virtual address are used to point to an entry in a page table located in system memory. Each page table entry contains the upper 20 bits of a physical address (a "physical page" address). For simplicity, each page table entry is 4 bytes. The total size of the page table depends on the GART range (called the "aperture size") which is programmable in the VT8601A.

This scheme is shown in the figure below.

Figure 4. Graphics Aperture Address Translation

Since address translation using the above scheme requires an access to system memory, an on-chip cache (called a "Translation Lookaside Buffer" or TLB) is utilized to enhance performance. The TLB in the 82C501 contains 16 entries. Address "misses" in the TLB require an access of system memory to retrieve translation data. Entries in the TLB are replaced using an LRU (Least Recently Used) algorithm.

Addresses are translated only for accesses within the "Graphics Aperture" (GA). The Graphics Aperture can be any power of two in size from 1MB to 256MB (i.e., 1MB, 2MB, 4MB, 8MB, etc). The base of the Graphics Aperture can be anywhere in the system virtual address space on an address boundary determined by the aperture size (e.g., if the aperture size is 4MB, the base must be on a 4MB address boundary). The Graphics Aperture Base is defined in register offset 10 of device 0. The Graphics Aperture Size and TLB Table Base are defined in the following register group (offsets 84 and 88 respectively) along with various control bits.

Device 0 Offset 83-80 - GART/TLB Control.....RW

15-4 Reservedalways reads 0

3 VGA-Present on AGP

0 Forward VGA accesses to PCI Bus default
1 Forward VGA accesses to AGP Bus

Note: VGA addresses are memory A0000-BFFFFh and I/O addresses 3B0-3BBh, 3C0-3CFh and 3D0-3DFh (10-bit decode). "Mono" text mode uses B0000-B7FFFh and "Color" Text Mode uses B8000-BFFFFh. Graphics modes use Axxxxh. Mono VGA uses I/O addresses 3Bx-3Cxh and Color VGA uses 3Cx-3Dxh. If an MDA is present, a VGA will not use the 3Bxh I/O addresses and B0000-B7FFFh memory space; if not, the VGA will use those addresses to emulate MDA modes.

2 Block / Forward ISA I/O Addresses

0 Forward all I/O accesses to the AGP bus if they are in the range defined by the I/O Base and I/O Limit registers (device 1 offset 1C-1D)

..... default
1 Do not forward I/O accesses to the AGP bus that are in the 100-3FFh address range even if they are in the range defined by the I/O Base and I/O Limit registers.

1-0 Reservedalways reads 0

Device 0 Bus 1 Header Registers - Graphics Accelerator

The Apollo PLE133 2D / 3D Graphics Accelerator is fully compliant with PCI bus interface protocol revision 2.2. The controller implements slave functions of PCI to accept cycles initiated by PCI masters targeted for its internal registers, RAMDAC™, frame buffer, and/or BIOS. It will accept only one data transaction for non-memory type transfers; however burst read/write transfers for frame buffer accesses are also implemented for performance enhancement. Bursting is disabled when accessing memory mapped I/O. Data parity will be generated for read cycles.

To support the PC AT architecture, palette snooping is supported. There are two different palette snooping modes: (1) snooping due to PCI retry, and (2) snooping due to master abort. Both modes are supported. The video BIOS will automatically determine the correct snooping mode in a PCI based system during power up. The PLE133 follows the PCI 2.2 specification running at 33 MHz or lower system clock frequencies. For packed pixel modes, if the first data TRDY is not generated within 16 clocks, a retry will be issued. During bursting, if successful data is not generated within 8 clocks, a retry will also be issued.

The table below lists the commands implemented by the PLE133 graphics controller PCI interface. Note that codes not listed (0000 interrupt acknowledge, 0001 special cycle, 0100, 0101, 1000, 1001 reserved, and 1101 dual address cycle) are not decoded and DEVSEL# is not generated. No action takes place inside the chip for these codes.

Table 6. Supported PCI Command Codes

Command Code	Command
0010	I/O Read
0011	I/O Write
0110	Memory Read
0111	Memory Write
1010	Configuration Read
1011	Configuration Write
1100	Memory Read Multiple (treated as simple memory read)
1110	Memory Read Line (treated as simple memory read)
1111	Memory Write and Invalid (treated as simple memory write)

The PCI configuration space is fully implemented. Due to the second memory base register, all I/O registers can be memory mapped; which allows more than one graphics controller to be installed within a system by mapping memory and I/O to different locations.

All configuration registers are located in PCI configuration space and should be programmed using PCI configuration mechanism 1 through CF8 / CFC with bus number equal to one and function number and device number equal to zero.

There are three memory base registers. The first defines the memory base location for the graphics frame buffer. The second defines the memory base for the memory mapped I/O locations. The third defines the memory base for the second video aperture. With this second aperture, graphics data and video data can be sent to the PLE133 simultaneously.

The PLE133 supports the PCI Bus Master mode which can send captured video data directly to system memory for processing. The registers to control the PCI Bus Master are defined in following sections (they are all in PCI configuration space).

Offset 1-0 - Vendor ID (1023h)..... RO

15-0 ID Codealways reads 1023h

Offset 3-2 - Device ID (8500h)..... RO

15-0 ID Codealways reads 8500h

Offset 5-4 - Command.....RW

- 15-10 Reserved** always reads 0
- 9 Fast Back-to-Back Cycle Enable** RO

15-0 Subsystem ID..... default = 00

Offset 33-30 –Graphics ROM Base.....RW

31-0 Graphics ROM Base..... default = 0000 0001

Offset 3C – Interrupt Line..... RW

7-0 Interrupt Line..... default = 0Bh

Offset 3D – Interrupt Pin..... RO

7-0 Interrupt Pin.....always reads 01h (INTA#)

Interrupts

There are several interrupt sources and their corresponding controls in the PLE133 as shown in the following table:

Table 7. Interrupt Sources and Controls

Source	Mask	Clear	Status
Capture ³	CR9B[7]	CR9B[6] ¹	CR9B[4]
Capture VSYNC	²		
Capture Even Field	²		
Capture Odd Field	²		
Capture Blank	²		
GE ⁴	2122[7]	2122[7]	2120[4]
VGA ⁵	CR11[5]	CR11[4]	

- 1) Write 0 to clear.
- 2) Selected by CR9E[7:6]
- 3) Video capture logic can generate an interrupt which is selected from one of four sources determined by CR9E.[7:6]. This interrupt is enabled by CR9B[7]. To clear this bit write 0 to CR9B[6]. Whether an interrupt is generated can be determined from CR9B[4].
- 4) The GE interrupt is similar to the capture interrupt.
- 5) The VGA interrupt is similar to the capture interrupt except that there is no status bit.

Device 0 Bus 1 Graphics Accelerator Registers

Offset 93-90 – Power Management 1.....RO

- 31-27 Reserved** always reads 0
PME# not supported
- 26 D2 State (Suspend) Supported** always reads 1
The D2 state is supported
- 25 D1 State (Standby) Supported** always reads 1
The D1 state is supported
- 24-22 Reserved** always reads 0
- 21 Device Specific Initialization** always reads 1
Special DSI is required from the video BIOS
- 20 Reserved** always reads 0
Auxiliary power source not supported
- 19 Reserved** always reads 0
PME# generation not supported
- 18-16 PCI PM Version #** always reads 001b
- 15-8 Next Item Pointer** always reads 0
- 7-0 PCI PM Capable** always reads 01h
This device is PCI PM capable

Offset 97-94 – Power Management 2..... RW

- 31-24 Reserved** always reads 0
Power dissipation reporting not supported
- 23-16 Reserved** always reads 0
- 15 D3 Cold Supported** always reads 0
D3 cold not supported
- 14-13 Data Scale** always reads 0
Power dissipation reporting not supported
- 12-9 Power Consumed / Dissipated** always reads 0
Power dissipation reporting not supported
- 8 Reserved** always reads 0
PME# for D3 cold not supported
- 7-2 Reserved** always reads 0
- 1-0 Power State**
 - 00 Fully On default
 - 01 Standby
 - 10 Suspend
 - 11 D3hot, similar to suspend

Graphics Accelerator PCI Bus Master Registers

The PLE133 PCI Bus Master controller supports both read/write and scatter/gather. Software can take advantage of this feature to transfer data between system memory and the frame buffer. After software sets the proper registers and commands, the PCI master begins to transfer data automatically between system memory and the frame buffer. This allows the CPU to do other jobs at the same time, thus increasing performance.

Software should use the PCI Bus Master functionality to transfer big chunks of data such as video capture data for video conferencing applications or texture data for 3-D applications. For small chunks of data, direct CPU access to the Frame Buffer is the preferred method.

The software sequence used to control bus master operation is as follows: Software first sets registers such as the system memory starting address, page table starting address / height / width, and frame buffer starting address and line offset. Software finally sets the bus master control register where either bit 1 (for reads) or bit 2 (for writes) is set as the command bit. After the command bit is set, the hardware will begin to transfer data automatically based on the parameters specified. After the transfer is finished, the hardware will issue an interrupt. Software can then poll the status bit to get the transfer status. The hardware will clear the command bit after the transfer is finished. Software cannot issue new commands until the previous command is completed.

All Registers are memory mapped. The memory address base is defined in PCI configuration register “Memory Base 1” (offset 17h-14h).

Port 2204 – Graphics Bus Master StatusRO

- 31-3 Reserved** always reads 0
- 2 Bus Master Interrupt Status**
- 1 End of Transfer**
 - 0 Still processing.....default
 - 1 End of Transfer (Idle)
- 0 Bus Master Error Status**
 - 0 Normaldefault
 - 1 Error Detected

This error is usually detected because the total page table size is less than the size defined in the “Graphics Bus Master Height” register at index 2314h.

Port 2300 – Graphics Bus Master Control..... RW

- 31-16 Reserved**always reads 0
- 15 PCI Master Read Data to GE SRCQ**
 - 0 Disable..... default
 - 1 Enable
- 14-11 Bytes in DW to be Cleared**
When enabling block transfer with clear, one bits define which byte(s) in the DW will be cleared
- 10 Enable Bit with Clear**
 - 0 Disable..... default
 - 1 Enable
- 9 Invert C / Z Position**
 - 0 Hardware assumes C is located in bits 15:0 and Z in bits 31:16..... default
 - 1 Hardware assumes C is located in bits 31:16 and Z in bits 15:0
- 8 Enable Z Stripping**
 - 0 Disable..... default
 - 1 Enable
- 7-5 Reserved**always reads 0
- 4 Bus Master Interrupt**
 - 0 Disable..... default
 - 1 Enable
- 3 Master Latency**
 - 0 Disable..... default
 - 1 Enable
- 2 Write Command**..... default =0
Writing this bit to 1 will trigger the hardware to begin a write operation. After finishing the operation, hardware will automatically clear this bit.
- 1 Read Command** default =0
Writing this bit to 1 will trigger the hardware to begin a read operation. After finishing the operation, hardware will automatically clear this bit.
- 0 Scatter / Gather**
 - 0 Disable..... default
 - 1 Enable

Port 2310 – Graphics Bus Master System Start Addr...RW

31-0 System Start Address

If scatter / gather is enabled, bits 31:12 point to the physical region translation table (the page starting address must be aligned on 4KB address boundaries) and bits 11:0 are the offset within a page.

Physical Region Descriptor Table

While system memory is allocated in a non-contiguous space, software needs to provide a physical region description table in system memory and pass the table's starting address to hardware.

The table size must less than or equal to 4K bytes and the table cannot cross the 4K boundary.

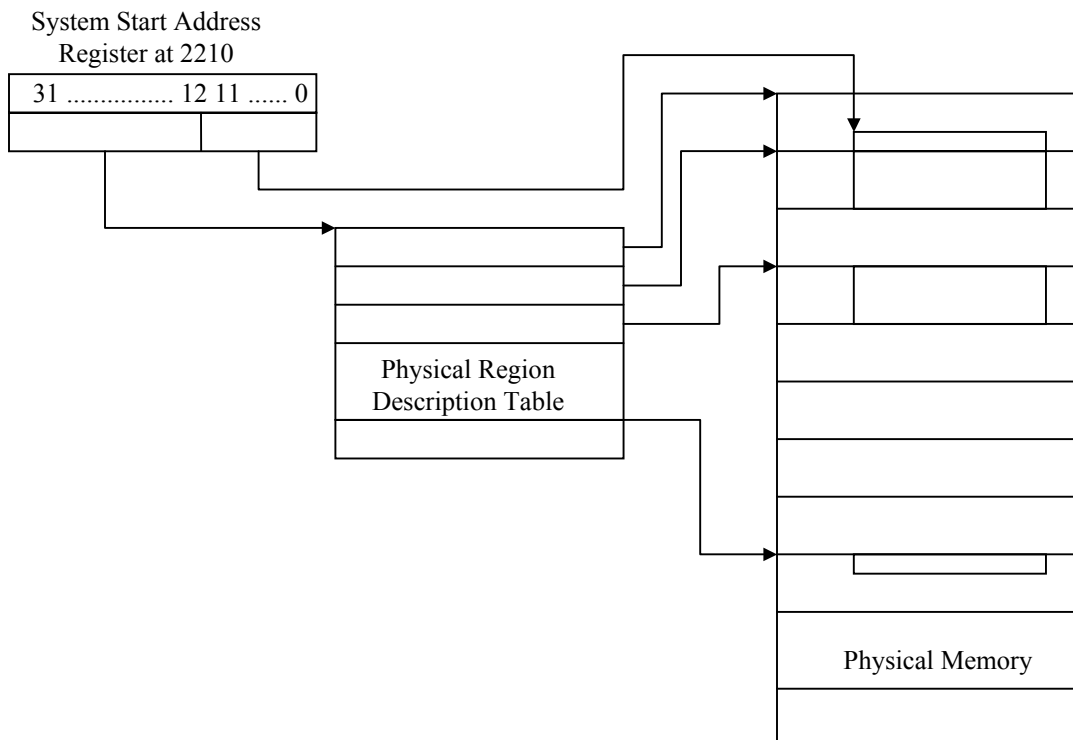

Figure 5. Physical Region Descriptor Table Format

BYTE3	BYTE2	BYTE1	BYTE0
Page 0 physical address			EOT
Page 1 physical address			EOT
.....			
Page n physical address			EOT

EOT = End of Table

Each table entry is 4 bytes in length. Hardware assumes that the physical page is always 4K. Bits 31:2 indicate the physical page starting address. Bit 0 of the first byte indicates the end of the table. Bus Master operation terminates when the last descriptor has been retired.

Figure 6. PCI Bus Master Address Translation

Port 2314 – Graphics Bus Master Height..... RW

- 15-10 Reservedalways reads 0
- 9-0 Source Data Height

Port 2316 – Graphics Bus Master Width RW

- 15-12 Reservedalways reads 0
- 11-0 Source Data Width (in bytes)

Port 2318 – Graphics Bus Master FB Start Addr/Pitch RW

- 31-22 Frame Buffer Line Offset (FB pitch) in quadwords
- 21-20 Reservedalways reads 0
- 19-0 Frame Buffer Start Address (quadword aligned)

Port 231C – Graphics Bus Master System Pitch RW

- 15-12 Reservedalways reads 0
- 11-0 System Row Byte Offset (pitch) in bytes

Port 2320 – Graphics Bus Master Clear Data..... RW

- 31-0 Clear Data Value
Used as the “clear” value for “block transfer with clear”

Graphics Accelerator AGP Registers

The default base I/O address for the AGP registers is 2300h.

The AGP control unit has 3 channels. These channels can work independently and in parallel. Each channel has its own capabilities:

Channel 0: Execution mode texture access.

Channel 1: Command List Operation. Executes command lists from AGP memory.

Channel 2: Data Move. Moves data from AGP memory to frame buffer or to the Capture/MPEG2 FIFO. Also moves data from the frame buffer to AGP memory.

Graphics AGP Configuration Registers

Port 2304 – Graphics AGP Capability List.....RW

31-0 xx

Port 2334 – Graphics AGP Capability List Address.....RW

31-0 xx

Graphics AGP Operation Registers

Port 2340 – Graphics AGP FB Command List Start.....RW

31-19 Reserved always reads 0
18-0 Frame Buffer Command List Start Address

Port 2344 – Graphics AGP FB Command List Size.....RW

31-19 Reserved always reads 0
18-3 Frame Buffer Command List Size (in quadwords)
Value programmed is the desired size minus one
2-0 Reserved always reads 0

Command List Format

The command list is stored in AGP memory in groups. Each group has the following format:

QuadWord	Bit		Bit		
	63	48	32	31	16
0	Data 0		Header		
1	Data 2		Data 1		
2	Data 4		Data 3		
...		
n / 2 + 1	Pad/Data n-1		Data n – 1/2		

The header is a 32-bit word that contains information about this group, such as the amount of useful data in the group. A group is always padded to a quadword boundary. Padding DWORDs are discarded by the channel. The format of the header is as follows:

31 Consecutive Addressing

- 0 Disabled (all data in this group will be written to the register with the destination address specified in the “ADDR” field in bits 29-8)
- 1 Enabled (All data in this group will be written to registers ADDR, ADDR+4, ... ADDR+4 * (LEN-1) sequentially)

30 Wait

- 0 Don’t Wait (send data to the Graphics Engine as long as it can receive it)
- 1 Wait (until the GE is idle, then send data)

29-8 Register Address of the First Data (ADDR)

15-0 Number of DWORDs of Data in this Group (LEN)

Port 2348 – Graphics AGP Channel 1 FB Start/Pitch...RW

- 31-22 Frame Buffer Line Offset (in quadwords)
- 21-19 Reserved always reads 0
- 18-0 Frame Buffer Starting Address

Port 234C – Graphics AGP Channel 1 FB Size.....RW

- 31-13 X Direction (in quadwords minus one)
- 12-10 Reserved always reads 0
- 9-0 Y Direction (in pixels minus one)

Port 2350 – Graphics AGP Channel 1 System Start.....RW

- 31-3 Channel 1 System Memory Start Address
(quadword aligned)
- 2-1 Reserved always reads 0
- 0 Command List Operation Trigger
This bit is the same as bit-19 of register 2368h (Channel 1 Read Enable). It is used to trigger command list operation and force bit-17 of register 2368h (Channel 1 Destination Select) to 1 (to select the GE Command FIFO).

Port 2354 – Graphics AGP Chan 1/2 System Pitch.....RW

- 31-27 Reserved always reads 0
- 26-16 Ch 2 System Memory Line Offset (in quadwords)
- 15-11 Reserved always reads 0
- 10-0 Ch 1 System Memory Line Offset (in quadwords)

Port 2358 – Graphics AGP Channel 2 System Start.....RW

- 31-3 Channel 2 System Memory Start Address
(quadword aligned)
- 2-0 Reserved always reads 0

Port 235C – Graphics AGP Channel 2 FB Start/Pitch .RW

- 31-22 Frame Buffer Line Offset (in quadwords)
- 21-19 Reserved always reads 0
- 18-0 Frame Buffer Starting Address

Port 2360 – Graphics AGP Channel 2 FB Size.....RW

- 31-27 Reserved always reads 0
- 26-16 Ch 2 System Memory Line Offset (in quadwords)
- 15-11 Reserved always reads 0
- 10-0 Ch 1 System Memory Line Offset (in quadwords)

Port 2364 –Channel Arbitration Counter Threshold.... RW

Port 2388 – Graphics AGP Command..... RW

31-0 xx

Command List Operation

The PLE133 implements an internal block called the “Command List Control Unit” to process command lists. Command list operation is invisible to software. After initialization of the Command List Control Unit, software can set registers as if there is no Command List Control Unit. If an engine is idle and there are no pending commands in the command buffer, data will be passed to the corresponding register directly. Otherwise, address and data will be stored into the command buffer to be processed later. When the engine is idle, the Command List Control Unit will fetch commands from the command buffer which is located in video memory and send it to the engine. There are two registers that determine the lower and upper bounds of the command buffer, the Command Buffer Start and Command Buffer End registers. The Command List Control Unit uses the command buffer in a round robin fashion, i.e., the address is wrapped around when it passes the end of the buffer.

Registers in the Setup Engine, Rasterization Engine, Pixel Engine, Memory Interface, and data from the host CPU and the drawing environment can be buffered by the Command List Control Unit. Command List Control registers and VGA extension registers cannot be buffered. Every entry in the command buffer is 64-bit with the lower 32 bits for the register address and the higher 32 bits for register data. In order to optimize memory bandwidth usage, the Command List Control Unit maintains one read and one write FIFO in its interface to memory in order to burst information from the read/write command list.

Port 23B0 –Command Buffer Start Address.....RW

31-30 Command List Mode

- 00 Disable Command Bufferdefault
- 01 Enable Command Buffer
- 10 Flush Command Buffer Then Disable (after first completing any commands in the existing command buffer)
- 11 -reserved-

29-24 Reserved always reads 0

23-0 Command Buffer Start Address

Starting address of the command buffer in bytes (quadword aligned). Writing to this register will set the internal buffer start and end pointers to this address.

Port 23B0 –Command Buffer End Address.....RW

31-24 Reserved always reads 0

23-0 Command Buffer End Address

End address of the command buffer in bytes (quadword aligned). This address should be programmed to one more than the address of the last byte of the command buffer.

Capture / ZV Port Registers

Port 2200 – Capture / ZV Port Command RW

VGA Registers

VGA Standard Registers - Introduction

The standard VGA register set consists of five sets of indexed registers plus several individually addressed registers. All VGA registers are addressed at specific I/O port addresses defined by the VGA legacy standard.

The non-indexed registers (also called the “Status / Enable” registers) are:

Input Status Register 0	Read at 3C2
Input Status Register 1	Read at 3BA or 3DA
Miscellaneous Register	Read at 3CC, Write at 3C2
Video Subsystem Enable	Read/Write at 3C3
Display Adapter Enable	Read/Write at 46E8

The indexed register sets each control different functional blocks inside the hardware VGA logic. These register sets are:

Attribute Controller	21 registers (0-14h) at 3C0/1
Sequencer	5 registers (0-4h) at 3C4/5
Graphics Controller	9 registers (0-8h) at 3CE/F
CRT Controller	25 registers (0-18h) at 3x4/5
RAMDAC	256 24-bit registers at 3C7-3C9

Indexed registers typically require two sequential port addresses, the first of which is the index and the second of which is the data. In other words, the index is written to the first port address and then the data corresponding to that indexed register is read from or written to the second port address. The exceptions to this are the Attribute Controller and the RAMDAC. For the Attribute Controller, the index is written at 3C0 as expected. Data reads (but not writes) can be performed from port 3C1 in the standard way. However, generally most data read and all data write operations use the same 3C0 port as used for the index. Data and address are accessed on alternate operations to 3C0 with an internal flag to keep track of where the next operation is to be performed (reads from 3BA or 3DA reset the flag to point at the index register). The other exception to the 2-port index/data structure is the RAMDAC which uses three port addresses. In this case, there are two locations provided for the index, 3C7 and 3C8, with the data at 3C9. There is actually only one index register, but automatic pre / post incrementation is performed differently depending on whether the index is written at the “Read” address (3C7) or the “Write” address (3C8). The current index value may be read at 3C8. Refer to the RAMDAC register group for further explanation of the operation of the index registers and sequential access to the three data bytes of each indexed data location.

The number of registers listed above for each indexed register group is the number of registers defined by the VGA standard. The operation of these “base” registers will always be exactly the same from one vendor’s implementation of the VGA to another. Typically, however, there are additional non-standard / extended functions implemented in higher numbered index values. That is the case for this chip as well,

where extended functions are provided in all indexed register groups except the Attribute Controller (due to the unusual nature of Attribute Controller indexing using a single I/O port which makes access to this register group more cumbersome). This document will detail the functions of all the standard VGA registers first. All extended functions will then be separately documented in following sections.

Regarding notation used in this document, indexed registers (including extended registers) may be referenced using a 2-letter mnemonic from the following table followed by the index number:

Attribute Controller	AR
Graphics Controller	GR
CRT Controller	CR
Sequencer	SR

For example, index register 26h of the 3CE / 3CFh indexed register group could also be referred to as GR26. Bit-7 if this register, using this notation, would be GR26[7].

Register groups, for the most part, are included in this document in order by I/O port address. Some registers are included out of order with other registers in the same functional block. Refer to the table of contents and the register summary tables at the beginning of the register section of this document for further information and help in finding descriptive information for a specific register.

For standard VGA registers, primarily only the bit definitions are provided here. Since the operation of these bits was standardized long ago, full explanation of the operation of these bits is not provided in this document. Detailed explanation of these bits is provided by many fine industry publications (check your local computer book store or the internet for further information).

Attribute Controller Registers (AR)

For this indexed register group, the index is accessed at 3C0 as expected. However, although data operations can be performed using port 3C1 in the standard way, data is generally accessed at 3C0 as well. In other words, data and address are accessed on alternate operations to 3C0 with an internal flag to keep track of where the next operation is to be performed. The state of the internal flag may be read back in the extended registers (see CR24). To set the internal flag to select the index (i.e., to set the flag so that the next access to port 3C0h points to the index register), read port 3BAh or 3DAh (depending on the state of the color / mono bit in the Miscellaneous Output Register at 3C2[0]). Attribute Controller register data may be read at 3C1 (the internal flag is not toggled) but must be written at 3C0.

Port 3C0 – VGA Attribute Controller Index.....RW

- 7-6 **Reserved** always reads 0
- 5 **Palette Address Source**
- 4-0 **Attribute Controller Index**
Only the lower 5 bits are implemented to allow access to Attribute Controller registers 0-14h.

Port 3C0/3C1 Index 0-F – Attr Ctrlr Color PaletteRW

- 7-6 **Reserved** always reads 0
- 5-0 **Color Value**

Port 3C0/3C1 Index 10 – Attr Ctrlr Mode Control.....RW

- 7 **P5 / P4 Select**
- 6 **Pixel Width**
- 5 **Pixel Panning Compatibility**
- 4 **Reserved** always reads 0
- 3 **Select Background Intensity or Enable Blink**
- 2 **Enable Line Graphics Character Mode**
- 1 **Display Type**
- 0 **Graphics / Text Mode**

Port 3C0/3C1 Index 11 – Attr Ctrlr Overscan Color.....RW

- 7-0 **Overscan Color**

Port 3C0/3C1 Index 12 – Attr Ctrlr Color Plane Ena ...RW

- 7-6 **Reserved** always reads 0
- 5-4 **Video Status Mux**
- 3-0 **Color Plane Enable for Color Planes 3-0**

Port 3C0/3C1 Index 13 – Attr Ctrlr H Pixel Panning....RW

- 7-4 **Reserved** always reads 0
- 3-0 **Horizontal Pixel Pan**

Port 3C0/3C1 Index 14 – Attr Ctrlr Color Select.....RW

- 7-4 **Reserved** always reads 0
- 3-0 **Color Select Bits 7-4**

VGA Status / Enable Registers

Port 3C2 – VGA Input Status 0..... RO

- 7 **Vertical Retrace Interrupt Pending**
- 6-5 **Reserved** always reads 0
- 4 **Switch Sense**
- 3-0 **Reserved** always reads 0

Port 3xA – VGA Input Status 1..... RO

This register is accessible at either 3BA or 3DA (shorthand notation 3xA) depending on the setting of Miscellaneous Output Register at 3C2[0].

- 7-6 **Reserved** always reads 0
- 5-4 **Diagnostic**
- 3 **Vertical Retrace**
- 2-1 **Reserved** always reads 0
- 0 **Display Enable (Inverted)**

Port 3C2 – VGA Miscellaneous Output Register (Write)WO

Port 3CC – VGA Miscellaneous Output Register (Read)RO

- 7 **Vertical Sync Polarity**
- 6 **Horizontal Sync Polarity**
- 5 **Page Bit for Odd / Even**
- 4 **Reserved** always reads 0
- 3-2 **Clock Select**
- 1 **Enable RAM**
- 0 **I/O Address Select**
 - 0 CRTC registers at 3Bx, Input Status 1 at 3BA
 - 1 CRTC registers at 3Dx, Input Status 1 at 3DA

Port 3C3 – VGA Video Subsystem Enable..... RW

- 7-1 **Reserved** always reads 0
- 0 **Video Subsystem Enable**

Port 46E8h – VGA Display Adapter Enable..... RW

- 7-4 **Reserved** always reads 0
- 3 **Display Adapter Enable**
- 2-0 **Reserved** always reads 0

VGA Sequencer Registers (SR)

Port 3C4 – VGA Sequencer Index.....RW

- 7-0 Sequencer Index**
Only the lower 3 bits are implemented in a standard VGA to point to Sequencer registers 0-4. However, all 8 bits are implemented here to allow for extended registers up to index FF.

Port 3C5 Index 0 – Sequencer Reset.....RW

- 7-2 Reserved** always reads 0
- 1 Synchronous Reset**
- 0 Asynchronous Reset**

Port 3C5 Index 1 – Sequencer Clocking Mode.....RW

- 7-6 Reserved** always reads 0
- 5 Screen Off**
- 4 Shift 4**
- 3 Dot Clock**
- 2 Shift Load**
- 1 Reserved** always reads 0
- 0 8/9 Dot Clocks**

Port 3C5 Index 2 – Sequencer Map MaskRW

- 7-4 Reserved** always reads 0
- 3 Enable Map 3**
- 2 Enable Map 2**
- 1 Enable Map 1**
- 0 Enable Map 0**

Port 3C5 Index 3 – Sequencer Character Map Select....RW

- 7-6 Reserved** always reads 0
- 5 Character Map Select A**
- 4 Character Map Select B**
- 3-2 Character Map Select A**
- 1-0 Character Map Select B**

Port 3C5 Index 4 – Sequencer Memory Mode.....RW

- 7-4 Reserved** always reads 0
- 3 Chain 4**
- 2 Odd / Even**
- 1 Extended Memory**
- 0 Reserved** always reads 0

VGA RAMDAC Registers

Port 3C6 – VGA RAMDAC Pixel Mask..... RW

- 7-0 Palette Address Mask**

Port 3C6 – VGA RAMDAC Command..... RW

This register is a non-standard VGA register (“extension register”) located at the same port address as the VGA RAMDAC Pixel Mask register. In order to maintain compatibility with standard VGA operations, access to this register is restricted: access is enabled by performing four successive accesses to the Pixel Mask register at 3C6 (i.e., read 3C6 four times).

- 7-4 Color Mode Select**
 - 0000 Pseudo-Color Mode..... default
 - 0001 Hi-Color Mode (15-bit direct interface)
 - 0010 Muxed Pseudo-Color Mode (16-bit pixel bus)
 - 0011 XGA Color Mode (16-bit direct interface)
 - 01xx -reserved-
 - 10xx -reserved-
 - 1100 -reserved-
 - 1101 True Color Mode (24-bit direct interface)
 - 111x -reserved-
- 3 Reserved** always reads 0
- 2 DAC Disable**
 - 0 DAC On (if SR20[0] = 1)..... default
 - 1 DAC Off
- 1 Reserved** always reads 0
- 0 RAMDAC Enable**
 - 0 Disable (Bypass) RAMDAC default
 - 1 Enable RAMDAC

Port 3C7 – VGA RAMDAC Read Index WO

Port 3C8 – VGA RAMDAC Write Index WO

Port 3C8 – VGA RAMDAC Index Readback..... RO

- 7-0 RAMDAC Index**

Port 3C9 Index 0-FF – RAMDAC Color Palette RW

- 7-0 RAMDAC Color Data**

There are 768 data entries in the palette consisting of 256 three-byte entries. R, G, and B 8-bit values are accessed on successive operations to this port with the index autoincremented after every 3 accesses. Refer to a VGA programmers guide for further information.

VGA Graphics Controller Registers (GR)

Port 3CE – VGA Graphics Controller IndexRW

- 7 **Reserved** always reads 0
- 6-0 **Graphics Controller Index**
Only the lower 4 bits are implemented in a standard VGA to allow access to Graphics Controller registers 0-8. However, 7 bits are implemented here to allow for extended registers up to index 7F.

Port 3CF Index 0 – Graphics Controller Set / Reset.....RW

- 7-4 **Reserved** always reads 0
- 3-0 **Set / Reset Planes 3-0**

Port 3CF Index 1 – Graphics Controller Set / Reset EnaRW

- 7-4 **Reserved** always reads 0
- 3-0 **Enable Set / Reset Planes 3-0**

Port 3CF Index 2 – Graphics Controller Color CompareRW

- 7-4 **Reserved** always reads 0
- 3-0 **Color Compare Planes 3-0**

Port 3CF Index 3 – Graphics Controller Data Rotate...RW

- 7-4 **Reserved** always reads 0
- 3 **Function Select**
- 2-0 **Rotate Count**

Port 3CF Index 4 – Graphics Ctrlr Read Map Select....RW

- 7-2 **Reserved** always reads 0
- 1-0 **Map Select**

Port 3CF Index 5 – Graphics Controller Mode RW

- 7 **Reserved** always reads 0
- 6 **256 Color Mode** default = 0
- 5 **Shift Register** default = 0
- 4 **Odd / Even** default = 0
- 3 **Read Mode** default = 0
- 2 **Reserved** always reads 0
- 1-0 **Write Mode** default = 0

Port 3CF Index 6 – Graphics Controller Miscellaneous RW

- 7-4 **Reserved** always reads 0
- 3-2 **Memory Map**
- 1 **Chain Odd Maps to Even**
- 0 **Graphics Mode**

Port 3CF Index 7 – Graphics Ctrlr Color Don't Care.. RW

- 7-4 **Reserved** always reads 0
- 3-0 **Color Don't Care Planes 3-0**

Port 3CF Index 8 – Graphics Controller Bit Mask RW

- 7-0 **Bit Mask**

VGA CRT Controller Registers (CR)

CRTC registers are accessible at either 3B4 / 3B5 or 3D4 / 3D5 (shorthand notation 3x4 / 3x5) depending on the setting of Miscellaneous Output Register 3C2 bit-0

Port 3x4 – VGA CRT Controller IndexRW

- 7-0 **CRT Controller Index**
Only the lower 5 bits are implemented in a standard VGA to allow access to CRTC registers 0-18h. However, all 8 bits are implemented here to allow for extended registers up to index FF.

Port 3x5 Index 0 – VGA CRTC – H TotalRW

- 7-0 **Horizontal Total**..... default = 0

Port 3x5 Index 1 – VGA CRTC – H Display Ena End...RW

- 7-0 **Horizontal Display Enable End** default = 0

Port 3x5 Index 2 – VGA CRTC – H Blank StartRW

- 7-0 **Horizontal Blanking Start**..... default = 0

Port 3x5 Index 3 – VGA CRTC – H Blank EndRW

- 7 **Reserved** always reads 0
- 6-5 **Display Enable Skew** default = 0
- 4-0 **Horizontal Blanking End** default = 0

Port 3x5 Index 4 – VGA CRTC – H Retrace StartRW

- 7-0 **Horizontal Retrace Pulse Start**..... default = 0FFh

Port 3x5 Index 5 – VGA CRTC – H Retrace EndRW

- 7 **Horizontal Blanking End** default = 0
- 6-5 **Horizontal Retrace Delay** default = 0
- 4-0 **Horizontal Retrace Pulse End**..... default = 0

Port 3x5 Index 6 – VGA CRTC – V TotalRW

- 7-0 **Vertical Total** default = 0

Port 3x5 Index 7 – VGA CRTC – OverflowRW

- 7 **Vertical Retrace Start Bit-9** default = 0
- 6 **Vertical Display Enable End Bit-9** default = 0
- 5 **Vertical Total Bit-9** default = 0
- 4 **Line Compare Bit-8** default = 0
- 3 **Vertical Blank Start Bit-8** default = 0
- 2 **Vertical Retrace Start Bit-8** default = 0
- 1 **Vertical Display Enable End Bit-8** default = 0
- 0 **Vertical Total Bit-8** default = 0

Port 3x5 Index 8 – VGA CRTC – Preset Row ScanRW

- 7 **Reserved** always reads 0
- 6-5 **Byte Panning** default = 0
- 4-0 **Preset Row Scan**..... default = 0

Port 3x5 Index 9 – VGA CRTC – Max Scan Line.....RW

- 7 **200 to 400 Line Conversion**..... default = 0
- 6 **Line Compare Bit-9** default = 0
- 5 **Vertical Blank Start Bit-9** default = 0
- 4-0 **Maximum Scan Line**..... default = 0

Port 3x5 Index A – VGA CRTC – Cursor Start RW

- 7-6 **Reserved** always reads 0
- 5 **Cursor On/Off** default = 0
- 4-0 **Cursor Row Scan Start**..... default = 0

Port 3x5 Index B – VGA CRTC – Cursor End RW

- 7 **Reserved** always reads 0
- 6-5 **Cursor Skew** default = 0
- 4-0 **Cursor Row Scan End** default = 0

Port 3x5 Index C / D – VGA CRTC Start Addr Hi/Lo. RW

..... default = 0

Port 3x5 Index E / F – VGA CRTC Cursor Loc Hi/Lo. RW

..... default = 0

Port 3x5 Index 10 – VGA CRTC – V Retrace Start RW

- 7-0 **Vertical Retrace Pulse Start** default = 0

Port 3x5 Index 11 – VGA CRTC – V Retrace End RW

- 7 **CR0-7 Write Protect** default = 0
- 6 **Reserved** always reads 0
- 5 **Vertical Interrupt Enable** default = 0
- 4 **Vertical Interrupt Clear** default = 0
- 3-0 **Vertical Retrace Pulse End**..... default = 0

Port 3x5 Index 12 – VGA CRTC – V Display Ena End RW

- 7-0 **Vertical Display Enable End** default = 0

Port 3x5 Index 13 – VGA CRTC – Offset RW

- 7-0 **Display Screen Logical Line Width** default = 0

Port 3x5 Index 14 – VGA CRTC – Underline Location RW

- 7 **Reserved** always reads 0
- 6 **Double Word Mode**..... default = 0
- 5 **Count By 4** default = 0
- 4-0 **Underline Location**..... default = 0

Port 3x5 Index 15 – VGA CRTC – V Blank Start RW

- 7-0 **Vertical Blanking Start**..... default = 0

Port 3x5 Index 16 – VGA CRTC – V Blank End RW

- 7-0 **Vertical Blanking End** default = 0

Port 3x5 Index 17 – VGA CRTC – Mode Control RW

- 7 **Hardware Rese** default = 0
- 6 **Word / Byte Mode** default = 0
- 5 **Address Wrap** default = 0
- 4 **VSYNC Update Select (VGA Extended Capability)**
0 **Base may only be updated during Vsync** def
1 **Base address may be updated during Hsync**
- 3 **Count By 2** default = 0
- 2 **Horizontal Retrace Select** default = 0
- 1 **Select Row Scan Counter**..... default = 0
- 0 **Compatibility Mode Support** default = 0

Port 3x5 Index 18 – VGA CRTC – Line Compare RW

- 7-0 **Line Compare** default = 0

VGA Extended Registers

VGA Extended Registers – Non-Indexed I/O Ports

Port 3D8 – Alternate Destination Segment AddrRW

7 **Reserved** always reads 0
 6-0 **Alternative Destination Segment Address** . def = 00
 Read / write of this register is enabled by GRF[2].
 This register becomes active when GR6[3-2] are not 00.

Port 3D9 – Alternate Source Segment AddressRW

7 **Reserved** always reads 0
 6-0 **Alternative Source Segment Address** def = 00
 Read / write of this register is enabled by GRF[2].
 This register becomes active when GR6[3-2] are not 00.

Port 3xB – Alternate Clock Select RW

3xB notation indicates that this register is accessible at either 3BB or 3DB depending on the setting of the color / mono bit.
 7-5 **New Mode Control Register Bits 3-1** def = 00
 These bits have the same function as SRD[3-1]
 4-2 **Reserved** always reads 0
 1-0 **Video Clock Select** def = 00

VGA Extended Registers – Sequencer Indexed

SR8 – Old / New Status.....RO

- 7 **Old / New Status** (see SRB, SRC, SRD, SRE, GRE)
 - 0 Olddefault
 - 1 New
- 6 **Interlace Scan Field**
 - 0 Odddefault
 - 1 Even
- 5 **Reserved** always reads 0
- 4 **Command FIFO Empty**
 - 0 Empty.....default
 - 1 Not Empty
- 3-0 **Reserved** always reads 0

SR9 – Graphics Controller Version.....RO

- 7-0 **Version Number**..... always reads 58h

SRB – Version / Old-New Mode ControlRW

7-0 **Graphics Controller Version #** always reads F3h
 A write to this register will change the Old / New Mode Control registers (SRD, SRE, and GRE) to the “old” definition. A read from this register will change the Old / New Mode Control registers to the “new” definition.

SRC – Configuration Port 1RW

Access to this register is enabled by SRE_Old[5] = 1 (“Select Configuration Port 1”) and writes are enabled by SRE_New[7] = 1 (“Configuration Port Write Enable”).

- 7 **Reserved** always reads 1
- 6 **Memory Bus Width**
 - 0 32-bit Memory Busdefault
 - 1 64-bit Memory Bus

Note: Although the PLE133 integrated graphics controller does not control memory directly (the system memory controller is used to access graphics memory as a portion of system memory), some functional blocks in the graphics controller (such as video) use this bit to manage their data bus widths.
- 5 **Reserved** always reads 1
- 4 **Video Subsystem Enable**
 - 0 46E8
 - 1 3C3default
- 3 **Video BIOS Size**
 - 0 64Kdefault
 - 1 32K
- 2-0 **Reserved** always reads 111b

SRC – Configuration Port 2RW

Access to this register is enabled by SRE_Old[5] = 0 (“Select Configuration Port 2”) and writes are enabled by SRE_New[7] = 1 (“Configuration Port Write Enable”).

- 7-0 **Reserved for BIOS**

SRD – Mode Control 2 (Old)..... RW

- 7-6 **Reserved**always reads 0
- 5 **Reserved** always reads 1
- 4 **Reserved**always reads 0
- 3 **CPU Bandwidth Select**
 - 0 Normal..... default
 - 1 Non-interrupted CPU access during VBLANK
- 2-0 **Reserved**always reads 0

SRD – Mode Control 2 (New)..... RW

- 7-4 **Display FIFO Memory Request Threshold Ctrl**
 - 0000 Empty 0 level
 - 0001 Empty 4 level..... default
 - 0010 Empty 8 level
 - 0011 Empty 12 level
 - 0100 Empty 16 level
 - 0101 Empty 20 level
 - 0110 Empty 24 level
 - 0111 Empty 28 level
 - 1000 Empty 32 level
 - 1001 Empty 36 level
 - 1010 Empty 40 level
 - 1011 Empty 44 level
 - 1100 Empty 48 level
 - 1101 Empty 52 level
 - 1110 Empty 56 level
 - 1111 Empty 60 level
- 3 **Reserved**always reads 0
- 2-1 **Video Clock Divide**
 - 00 Divide by 1 default
 - 01 Divide by 2
 - 10 Divide by 4
 - 11 Divide by 1.5
- 0 **Reserved**always reads 0

SRE – Mode Control 1 (Old).....RW

- 7 **Reserved**always reads 1
 - 6 **IRQ Polarity Select**
 - 0 Active High.....default
 - 1 Active Low
 - 5 **Configuration Port (SR0C) Select**
 - 0 Select Port 2
 - 1 Select Port 1default
 - 4 **Reserved** always reads 0
 - 3 **Memory Bus** **RO**
 - 0 8-bit
 - 1 16-bitalways reads 1
 - 2-1 **256K Bank Select**
 - 00 Bank 0.....default
 - 01 Bank 1
 - 10 Bank 2
 - 11 Bank 3
- Note: an inverted value will be written to bit-1
 These bits (and 3C2[5]) are write enabled when
 GR06[3-2] = 00. 3C2[5] is used as a page select to
 select one of the two 64KB pages.
- 0 **RAMDAC Pixel Clock Invert**
 - 0 Normaldefault
 - 1 Invert pixel clock to RAMDAC

SRE – Mode Control 1 (New).....RW

- 7 **Configuration Port Write Enable**..... default = 0
 - 0 Write Protect
 - 1 Write Enable
 Ports effected: SRC, SRF, CR28-2A, SRE_New[6-4]
 (this register), and SR10[0]
- 6 **CPU Bandwidth Select for Text Mode**
 - 0 132-Column Text
 - 1 Other Text.....default
- 5-0 **64K Bank Select** default = 0
Bit-1 should be inverted when performing writes
 These bits are enabled when GR06[3-2] are written
 with any value other than 00.

SRF – Power-up Mode 2 RW

- This register is write protected by SRE_New[7].
- 7 **Reserved** always reads 1
 - 6 **BIOS Control**
 - 0 Disabled..... default
 - 1 Enabled
 - 5 **Palette Mode**
 - 0 Master Abort Mode
 - 1 Intel Retry Mode default
 - 4 **Linear / Bank Addressing Control**
 - 0 Linear Only
 - 1 Linear / Bank..... default
 - 3-0 **Reserved for BIOS** default = 1111

SR10 – VESA™ Big BIOS Control..... RW

- 7 **Extended VESA™ Big BIOS Enable**
 - 0 Disabled default
 - 1 Enabled
- 6-5 **Video Address Select**..... **RO**
 - 00 A0000-A7FFF default
 - 01 -reserved-
 - 10 B0000-B7FFF
 - 11 B8000-BFFFF
 These bits are decoded from GR6[3-2]
- 4-1 **Reserved**always reads 0
- 0 **Page Select**
 - 0 Select the original C0000-C7FFF access..... def
 - 1 Select extended access defined by bits 6-5
 Bit-0 of this register is write protected by SRE_New[7].

SR11 – Protection RW

- 7-0 **Register Protection Enable**..... default = 00
 - 87 Unprotect all extended registers except those
 which may still be protected by SRE_New[7]
 - 92 Unprotect all extended registers independent
 of SRE_New[7]
 If any value other than the ones listed above is
 programmed into this register, all extended registers
 will be write protected.

SR12 – Threshold RW

- 7-4 **Queue Threshold Playback and Capture**..... def = 2
 Threshold of the display queue when both playback
 and capture are enabled (for definition see SRD.new).
- 3-0 **Queue Threshold Playback or Capture**..... def = 1
 Threshold of the display queue when either playback
 or capture are enabled (for definition see SRD.new)
 The old threshold is used when neither playback nor capture is
 enabled. All three thresholds cannot be set to 0. Other
 definitions are the same as the original.

Graphics Clock Synthesizer Control

SR18 – VCLK1 Frequency Control 0.....RW

7-0 VCLK1 Frequency Generator Numerator def=0

SR19 – VCLK1 Frequency Control 1.....RW

7-6 VCLK1 Frequency Generator K-Factor def=0

5-0 VCLK1 Frequency Generator Denominator def=0

SR1A – VCLK2 Frequency Control 0.....RW

7-0 VCLK2 Frequency Generator Numerator def=0

SR1B – VCLK2 Frequency Control 1.....RW

7-6 VCLK2 Frequency Generator K-Factor def=0

5-0 VCLK2 Frequency Generator Denominator def=0

SR20 – Clock Synthesizer / RAMDAC Setup RW

7 **Reserved**always reads 0

6 **Multiplex Mode Sync Mechanism**

0 Normal Mode default

1 Enable synchronization in multiplexed mode for high VCLK tracking

5 **Simultaneous VAFC and Playback**

0 Simultaneous VAFC / playback display default

1 Playback only

4 **VAFC and Playback Display Overlay**

0 VAFC is on top..... default

1 Playback is on top

3 **DAC Test Mode**

0 Disable..... default

1 Enable

2 **Video Mode**

0 Disable..... default

1 Enable

1-0 **Video Mode Select**

x0 5-5-5 Hi-color..... default = 0

x1 5-6-5 XGA-color

0x Video Playback, True-color

1x Video Playback, 256-color

Table 8. Graphics Clock Frequencies – 14.31818 MHz Reference

<u>Denominator Value</u>	<u>Numerator Value</u>	<u>N</u>	<u>M</u>	<u>K</u>	<u>Actual Frequency</u>	<u>Expected Frequency</u>	<u>Frequency Error %</u>
88	3E	62	8	2	25.057	25.175	-0.0047
89	4F	79	9	2	28.311	28.322	-0.0004

 - 1 Don't Enabledefault
- 5-4 Clock Input Divisor**
Divisor for 14.318 MHz clock input to MCLK to drive DRAM refresh cycles in power managed modes.
 - 00 1default
 - 01 2
 - 10 4
 - 11 8
- 3 Power Management Slow MCLK**
 - 0 Use divided MCLK during standby & suspend
 - 1 Use MCLK during standby & suspend def
- 2 Enable MCLK VCO Directly**
(without warmup sequence)
 - 0 Enable
 - 1 Don't Enabledefault
- 1 Enable MCLK VCO Directly**
(without warmup sequence)
 - 0 Enable
 - 1 Don't Enabledefault
- 0 DAC Power**
 - 0 Offdefault
 - 1 On

Graphics Connector Control Registers

SR25 – Monitor Sense RO

- 7-3 Reserved** always reads 0
- 2-0 Monitor Sense Result: [red, green, blue]**

SR37 – Video Key Mode RW

- 7 Feature Connector Input Clock Polarity**
 - 0 Normal..... default
 - 1 Inverted
- 6 Signal Output (AFC Processing)**
 - 0 Signal output is sent before AFC processingdef
 - 1 Signal output is sent after AFC processing
- 5-4 Feature Connector Input Pixel Clock Tuning**
 - 00 0 ns default
 - 01 4 ns
 - 10 8 ns
 - 11 12 ns delay of pixel clock with respect to data
- 3-0 Overlay Key Type**
 - 0000 VGA Port Only..... default
 - 0001 Color Key & Video Key
 - 0010 Color Key & not Video Key
 - 0011 Color Key
 - 0100 Not Color Key & Video Key
 - 0101 Video Key
 - 0110 Color Key XOR Video Key
 - 0111 Color Key | Video Key
 - 1000 Not Color Key & Not Video Key
 - 1001 Color Key XNOR Video Key
 - 1010 Not Video Key
 - 1011 Color Key | Not Video Key
 - 1100 Not Color Key
 - 1101 Not Color Key | Video Key
 - 1110 Not Color Key | Not Video Key
 - 1111 Video Port Only

SR38 – Advanced Feature Connector (AFC) Control... RW

- 7 Reserved** always reads 0
- 6 DCLK Rate** (set after other bits for synchronization)
 - 0 PCLK default
 - 1 PCLK / 2
- 5 DCLK Phase Select** (if bit-6 = 1)
 - 0 180 degree phase shift default
 - 1 In phase
- 4 DCLK Output Polarity**
 - 0 Normal when bit-6 = 0 default
 - 1 Inverted
- 3 VCLK Input Polarity**
 - 0 Normal..... default
 - 1 Inverted
- 2-1 Reserved** always reads 0
- 0 Pixel Data Bus Output Enable Control**
 - 0 Disable Output Drive..... default
 - 1 Disable drive only when EVIDEO# is low

Graphics Playback Control Registers

SR52-50 – Playback Color Key Data.....RW

- 23-16 Playback Color Key for True Color Mode
- 15-8 Playback Color Key for High Color Mode
- 7-0 Playback Color Key for 256 Color Mode

SR56-54 – Playback Color Key MaskRW

- 23-16 Playback Color Key Mask for True Color Mode
- 15-8 Playback Color Key Mask for High Color Mode
- 7-0 Playback Color Key Mask for 256 Color Mode

SR57 – Playback Video Key Mode FunctionRW

- 7-0 **Overlay Key Type**
 Defines all 256 different types of mixing among VGA Color Key, Playback Window Key, and Video Chroma Key (very similar to ROP3 code). Below are some common combinations:
 - 00 VGA Port Only
 - F0 Color Key Only
 - CC Playback Key Only
 - AA Chromakey Only
 - 88 Playback Key & Chromakey
 - C0 Colorkey & Playback Key
 - 80 Colorkey & Playback key & Chromakey
 - FF Video Port Only

Graphics BIOS Scratch Pad Registers

SR5A – Scratch Pad 0.....RW

SR5B – Scratch Pad 1.....RW

SR5C – Scratch Pad 2.....RW

SR5D – Scratch Pad 3.....RW

SR5E – Scratch Pad 4.....RW

SR5F – Scratch Pad 5.....RW

Graphics Second Playback Control Registers

SR62-60 – 2nd Playback Color Key Data RW

- 23-16 Playback Color Key for True Color Mode
- 15-8 Playback Color Key for High Color Mode
- 7-0 Playback Color Key for 256 Color Mode

SR66-64 – 2nd Playback Color Key Mask..... RW

- 23-16 Playback Color Key Mask for True Color Mode
- 15-8 Playback Color Key Mask for High Color Mode
- 7-0 Playback Color Key Mask for 256 Color Mode

Graphics Video Display Registers

SR82-80 – Window 1 U-Plane FB Start Address.....RW

- 23-20 **Reserved** always reads 0
- 19-0 **W1 U-Plane FB Start Address**
When operating in planar mode, this field defines the frame buffer starting address for the U-plane for the first live video window

SR85-83 – Window 1 V-Plane FB Start Address.....RW

- 23-20 **Reserved** always reads 0
- 19-0 **W1 V-Plane FB Start Address**
When operating in planar mode, this field defines the frame buffer starting address for the V-plane for the first live video window

SR88-86 – Window 2 Frame Buffer Start Address.....RW

- 23-20 **Reserved** always reads 0
- 19-0 **Window 2 Frame Buffer Start Address**
Frame buffer starting address for the second live video window (packed YUV format only)

SR8A-89 – Window 2 Horizontal Scaling FactorRW

- 15 **W2 Horizontal Minify / Zoom Select**
0 Zoom default
1 Minify
- Zoom Selected (Bit-15 = 0)**
- 14 **Reserved**
- 13-0 **W2 Horizontal Zoom Factor**
Same format as for the first live video window as defined in CR80 and CR81
- Minify Selected (Bit-15 = 1)**
- 14-13 **W2 Tap**
- 12-10 **W2 Horizontal Minify Integer (Inverter)**
- 9-0 **W2 Horizontal Minify Factor**

SR8C-8B – Window 2 Vertical Scaling Factor RW

- 15 **W2 Vertical Minify / Zoom Select**
0 Zoom default
1 Minify
- 14 **W2 Vertical Filtering**
0 Off default
1 On

Zoom Selected (Bit-15 = 0)

- 13-0 **W2 Vertical Zoom Factor**
Same format as for the first live video window as defined in CR82 and CR83

Minify Selected (Bit-15 = 1)

- 13-10 **Reserved**
- 9-0 **W2 Vertical Minify Factor**

SR90-8D – Window 2 Live Video Start RW

- 31-28 **Reserved** always reads 0
- 27-16 **W2 Vertical Starting Point**
- 15-12 **Reserved** always reads 0
- 11-0 **W2 Horizontal Starting Point**

SR94-91 – Window 2 Live Video End..... RW

- 31-30 **W2 Line Buffer Level Bits 8-7** (see SR95)
- 29-28 **Reserved** always reads 0
- 27-16 **W2 Vertical Ending Point**
- 15-12 **Reserved** always reads 0
- 11-0 **W2 Horizontal Ending Point**

SR95 – Window 2 Live Video Line Buffer Level RW

- 7 **Reserved** always reads 0
- 6-0 **W2 Line Buffer Level Bits 6-0** (see SR91[31-30])

SR96 – New Live Video Window Control 0.....RW

- 7 **W2 Horizontal Interpolation**
 - 0 Interpolation.....default
 - 1 Duplication
- 6 **W1 Vertical Interpolation U and V Components**
 - 0 Enable.....default
 - 1 Disable

This bit is effective only if window 1 vertical Y interpolation is enabled (CR8E[12] = 1)
- 5 **Reserved** always reads 0
- 4 **656**
 - 0 Disable.....default
 - 1 Enable
- 3 **W2 Color Space Converter (CSC) Bypass**
 - 0 Disable.....default
 - 1 Enable
- 2 **Reserved** always reads 0
- 1 **MC Even / Odd Inverter**
 - 0 Disable.....default
 - 1 Enable
- 0 **MC Interlace Display**
 - 0 Disable.....default
 - 1 Enable

SR97 – New Live Video Window Control 1.....RW

- 7 **Reserved** always reads 0
- 6 **Planar Mode X (Horizontal) Y/UV Ratio**
 - 0 2xdefault
 - 1 4x
- 5-4 **Planar Mode Y (Vertical) Y/UV Ratio**
 - 00 2x (Yp420).....default
 - 01 4x (Yp410)
 - 1x 1x (Yp422)
- 3 **Reserved** always reads 0
- 2-0 **Window Mode**..... default = 000b

	Format	Interpolation	Line Buffers
000	YUV422	H-V	(96+48) x 64
001	Planar	H-V	(96+48) x 64
01x	YUV	FIFO H	96 x 64
100	MPEG2 YUV422	H-V	2x(96+48)x64
101	MPEG2 Planar	H-V	2x(96+48)x64
11x	YUV422	H-V (V-YUV)	2x(96+48)x64

For 1xx, only one h/w overlay window is supported

SR98 – New Live Video Window Control 2..... RW

- 7-6 **Two Live Window Chroma Key Select**
 - 00 Chroma key only default
 - 01 Window 1 & chroma key
 - 10 Window 2 & chroma key
 - 11 (Window 1 | Window 2) & chroma key
- 5-4 **W1 Anti-Flicker Removal**
 - 00 Disable..... default
 - 01 One field is shifted up 1 line
 - 10 One field is shifted up 2 lines
 - 11 One field is shifted up 3 lines
- 3 **W1 Anti-Flicker Removal Field Selection**
 - 0 Odd field is shifted up default
 - 1 Even field is shifted up
- 2-1 **W2 Anti-Flicker Removal**
 - 00 Disable..... default
 - 01 One field is shifted up 1 line
 - 10 One field is shifted up 2 lines
 - 11 One field is shifted up 3 lines
- 0 **W2 Anti-Flicker Removal Field Selection**
 - 0 Odd field is shifted up default
 - 1 Even field is shifted up

SR99 – New Live Video Window Control 3..... RW

- 7 **Reserved** always reads 0
- 6 **Capture Address Swap Enable**
 - 0 Disable..... default
 - 1 Enable
- 5 **Capture Address Swap**
 - 0 No swap..... default
 - 1 Swap
- 4-2 **W2 HDE Delay Adjust**..... default = 0
- 1-0 **Reserved** always reads 0

SR9B-9A – Window 1 UV Video Row Byte Offset..... RW

- 15-14 **Reserved** always reads 0
- 13-0 **W1 UV Plane Video Row Byte Offset** (the bytes in a row)

SR9D-9C – Window 2 Y Video Row Byte Offset..... RW

- 15-14 **Reserved** always reads 0
- 13-0 **W2 Y Plane Video Row Byte Offset** (the bytes in a row)

SR9E – Line Buffer Request Threshold..... RW

- 7 **Reserved** always reads 0
- 6-0 **Line Buffer Request Threshold Level** def = 0

SR9F – VBI ControlRW

- 7 **VBI Interrupt StatusRO**
- 6 **Reserved always reads 0**
- 5 **VBI Bit-8**
- 4 **VBI IV Bit-8**
- 3 **VBI Interrupt**
 - 0 Disabledefault
 - 1 Enable
- 2 **VBI Enable**
 - 0 Disabledefault
 - 1 Enable
- 1-0 **VBI Data Format in Frame Buffer**
 - 00 Every field data overwritedefault
 - 01 Data in even/odd format
 - 10 Every two field data write contiguous
 - 11 -reserved-

SRAD-AC – VBI Vertical Interrupt Position RW

- 15 **Reserved always reads 0**
- 14-12 **Dithering Mode**
 - 000 Bypass dithering default
 - 001 -reserved-
 - 010 24 bpp dither to 16 bpp
 - 011 24 bpp chop to 16 bpp
 - 100 24 bpp dither to 15 bpp
 - 101 24 bpp chop to 15 bpp
 - 110 24 bpp dither to RGB8
 - 111 24 bpp chop to RGB8
- 11 **Capture CSC**
 - 0 Disable default
 - 1 Enable
- 10-0 **VINST[10-0]**

SRA3-A0 - VBI Frame Buffer Address.....RW

- 31-20 **VBI Row Byte Offset**
- 19-0 **VBI Start Address**

SRA7-A4 – VBI Capture Start.....RW

- 31-27 **Reserved always reads 0**
- 26-16 **VBI Vertical Start**
- 15-11 **Reserved always reads 0**
- 10-0 **VBI Horizontal Start**

SRAB-A8 – VBI Capture EndRW

- 31-27 **Reserved always reads 0**
- 26-16 **VBI Vertical End**
- 15-11 **Reserved always reads 0**
- 10-0 **VBI Horizontal End**

SRAF-AE – Capture Row Byte OffsetRW

- 15 **Reserved** always reads 0
- 14 **Capture Address Initial Control**
- 13-0 **Capture Row Byte**

SRB1-B0 – Window 1 HSB ControlRW

- 15-10 **Brightness**
 - 9-5 **Sin(Hue) * Saturation * 8** (bit-9 is the sign bit)
 - 4-0 **Cos(Hue) * Saturation * 8** (bit-4 is the sign bit)
- Hue range is 0-360 degrees (default = 0)
Saturation range is 0-1.875 (default = 1)

SRB3-B2 – Window 2 HSB ControlRW

- 15-10 **Brightness**
 - 9-5 **Sin(Hue) * Saturation * 8** (bit-9 is the sign bit)
 - 4-0 **Cos(Hue) * Saturation * 8** (bit-4 is the sign bit)
- Hue range is 0-360 degrees (default = 0)
Saturation range is 0-1.875 (default = 1)

SRB6-B4 – Second Display Address SelectRW

- 23-20 **Reserved** always reads 0
- 19-0 **Second Display Address for Double Buffering**
Second display address for double buffering instead of capture address

SRB7 – Video SharpnessRW

- 7-0 **Video Sharpness Factor**

SRBA-B8 – Second Capture Address SelectRW

- 23-20 **Reserved** always reads 0
- 19-0 **Second Capture Address for Double Buffering**
Second capture address for double buffering instead of display address

SRBC – Contrast ControlRW

- 7-4 **Window 2 Contrast**
- 3-0 **Window 1 Contrast**

SRBD – Dual View Mux Control RW

- 7-3 **Reserved** always reads 0
- 2-0 **CRT / TV View Multiplexing Control**
 - 00x Color key 1 determines top window (1=W1)def
 - 010 Video window 1 overlay
 - 011 Video window 2 overlay
 - 10x Window key defines window 1 on top
 - 11x Window key defines window 2 on top

SRBE – Miscellaneous Control Bits RW

- 7 **Planar Capture**
 - 0 Off default
 - 1 On
- 6-5 **Capture Start Address W/R Control (CR98[19-0])**
 - 0x W/R Y address default
 - 10 W/R U address
 - 11 W/R V address
- 4 **Video Engine Power Saving Mode**
 - 0 On default
 - 1 On
- 3 **Reserved** always reads 0
- 2 **Interpolation Bypass**
 - 0 Interpolation default
 - 1 Bypass
- 1 **Window 2 HSCB Enable**
 - 0 Bypass default
 - 1 Enable
- 0 **Window 1 HSCB Enable**
 - 0 Bypass default
 - 1 Enable

SRCE – Window 2 Live Video Control RW

- 7 **Reserved** always reads 0
- 6 **W2 Vertical Interpolation**
 - 0 Disable default
 - 1 Enable
- 5 **Planar Mode X (Horizontal) Y/UV Ratio**
 - 0 2x default
 - 1 4x
- 4-3 **Planar Mode Y (Vertical) Y/UV Ratio**
 - 00 2x (Yp420) default
 - 01 4x (Yp410)
 - 1x 1x (Yp422)
- 2-0 **Window Mode** default = 000b

Format	Interpolation	Line Buffers
000 YUV422	H-V	(96+48) x 64
001 Planar	H-V	(96+48) x 64
01x YUV	FIFO H	96 x 64
100 MPEG2 YUV422	H-V	2x(96+48)x64
101 MPEG2 Planar	H-V	2x(96+48)x64
11x YUV422	H-V (V-YUV)	2x(96+48)x64

For 1xx, only one h/w overlay window is supported

SRD1-D0 – Window 2 UV Row Byte Offset.....RW

- 15-14 Reserved always reads 0
- 13-0 W2 UV Plane Video Row Byte Offset (the bytes in a row)

SRD4-D2 – Window 2 U-Frame Start AddressRW

- 23-20 Reserved always reads 0
- 19-0 W2 U-Frame Start Address

SRD7-D5 – Window 2 V-Frame Start AddressRW

- 23-20 Reserved always reads 0
- 19-0 W2 V-Frame Start Address

SRD9-D8 – Digital TV Interface Control.....RW

(see also CRD0, VGA / Digital TV Sync Control)

- 15-14 Reserved always reads 0
- 13 DIVS I/O Control
- 12 DTVI Signal Output Control, except DIVS (Vsync)
- 11 Dual View Clock Inversion Control
- 10 Dual View Clock Control for DTVI
- 9 DICLK Inversion Control
- 8 DIVS Inversion Control
- 7 DIHS Inversion Control
- 6-5 YUV Order Inversion Control
- 4, 1 Data Out Control
 - 00 VGA / Video Overlay Data
 - x1 TV Data
 - 10 Data Direct from Video Engine
- 3-0 HS / VS / CLK Control
 - 0000 VGAHS, VGAVS, and PCLK
 - x100 VGAHS, VGAVS, and SPKTV
 - 1000 VGAHS, VGAVS, and PCLK x 2
 - xxx1 DVHS, DVVS, and LCDCLK
 - xx10 TVHS, TVVS, and TVCLK

SRDB-DA – Window 2 V-Count Status RO

- 15-0 W2 V Count Status

SRDD-DC – Dual View Control..... RW

- 15-11 Reserved always reads 0
- 10-9 Dual View Control - SHIF
- 8 Dual View Control – G Window Enable
- 7 Dual View Control – W2 Double Buffer Enable
- 6 Dual View Control – W1 Double Buffer Enable
- 5 Dual View Control – W2 Address Trans Enable
- 4 Dual View Control – W1 Address Trans Enable
- 3 Dual View Control – Digital TV Enable
- 2 Dual View Control – Digital Video LUT Write
- 1 Dual View Control – Digital Video LUT Read
- 0 Dual View Control – Digital Video CRT

SRDF-DE – Window 1 V-Count Status..... RO

- 15-13 Reserved always reads 0
- 12 DVV Sync
- 11-0 W1 V Count Status

VGA Extended Registers – Graphics Controller Indexed

GRE – Old Source Segment AddressRW

- 7-3 **Reserved** always reads 0
- 2-1 **Source Segment Address Select** default = 0
- 0 **Reserved** always reads 0

GRE – New Source Segment AddressRW

- 7 **Reserved** always reads 0
- 6-0 **Source Segment Address Select** default = 0
Bit-1 is written inverted

GRF – Miscellaneous Extended Function Control..... RW

- 7 **Reserved** always reads 0
- 6 **Character Clock Division Control Bit-1** (see bit-3)
 - 00 No division default
 - 01 Divide by 2
 - 10 Divide by 3
 - 11 -reserved-
- 5 **Symmetric / Asymmetric DRAM Address**
 - 0 Symmetric default
 - 1 Asymmetric
- 4 **Compressed Chain 4 Mode for CPU Path**
 - 0 Disable default
 - 1 Enable
- 3 **Character Clock Division Control Bit-0** (see bit-6)
- 2 **Alternate Bank & Clock Select**
 - 0 Disable 3D8, 3D9, and 3xB default
 - 1 Enable 3D8, 3D9, and 3xB
- 1 **Compressed Chain 4 Mode Display Path**
 - 0 Disable default
 - 1 Enable
- 0 **Source Segment Address Register Enable**
 - 0 Disable GRE default
 - 1 Enable GRE

All bits except 2 and 0 are write protected by SRE_New[7]

Power Management Registers

GR20 – Standby Timer Control.....RW

- 7 **Timer Initialize & Enable**
 - 0 Enable Timer.....default
 - 1 Initialize and hold standby and DPMS timer
- 6-4 **Timer Testing.....RO**
- 3-0 **Reserved** always reads 0

GR21 – Power Management Control 1RW

- 7 **Power Management Pin Polarity**
 - 0 Active High.....default
 - 1 Active Low
- 6 **PCI Power Management**
 - 0 Disabledefault
 - 1 Enable
- 5 **Suspend Mode**
 - 0 Normal modedefault
 - 1 Enter Suspend Mode
- 4 **Suspend Input Pin**
 - 0 Disabledefault
 - 1 Enable
- 3 **D3 to D0 Reset**
 - 0 Disabledefault
 - 1 Enable
- 2 **Standby Input Pin**
 - 0 Disabledefault
 - 1 Enable
- 1 **CLKRUN# Mechanism**
 - 0 Disabledefault
 - 1 Enable
- 0 **Consistent Standby / Suspend**
 - 0 The bits in the PCI PM configuration registers will be OR'ed with bits 5 and 3 of this register for connection to the internal PM state machine.....default
 - 1 The bits in the PCI PM configuration registers will be the same as bits 5 and 3 of this register to allow software coherency

GR22 – Power Management Control 2..... RW

- 7 **Timer Test Mode**
 - 0 Disable..... default
 - 1 Enable
- 6 **Refresh Clock Select**
 - 0 Crystal input or external clock (XMCLK) provides refresh clock during suspend .. default
 - 1 REFCLK is used as refresh clock during suspend for 64ms refresh (ignore “Suspend DRAM Refresh Mode” bits 5-4 below)
- 5-4 **Suspend DRAM Refresh Mode**
 - 00 No refresh..... default
 - 01 Self refresh
 - 10 Crystal clock provides rate for 8ms refresh
 - 11 Crystal clock provides rate for 64ms refresh
- 3 **Disable GPIO**
 - 0 Allow GPIO 7-0 pins to drive data in.... default
 - 1 Disable GPIO 7-0 pins (and their shared functions) from driving data. Tristates input buffers on pins so no power is consumed if GPIO pins are set to input mode.
- 2 **Reserved** always reads 0
- 1 **Hardware / Software Oscillator Select**
 - 0 Software controls oscillator off with bit-0 (prevents automatic oscillator shutdown without direct software control of the “Oscillator Disable” bit)..... def
 - 1 Hardware controls oscillator off (allow oscillator shutdown when power states are entered using hardware mechanisms)
- 0 **Oscillator Disable**
 - 0 Enable normal function default
 - 1 Disable (oscillator off)

GR23 – Power Status.....RW

- 7 **Power Management Pin Polarity** (see GR21[7])
- 6-5 **Chip Power Status**
 - 00 Ready
 - 01 Standby
 - 10 Suspend
 - 11 -reserved-
- 4 **LCD Power Sequence Status**
 - 0 LCD power sequencing is not occurring at this time
 - 1 LCD power sequencing is occurring at this time
- 3-2 **Panel Power Sequencing**
 - 00 Fast panel power sequencingdefault
 - 01 -reserved-
 - 10 -reserved-
 - 11 Slow panel power sequencing
- 1-0 **DPMS Power Status**
 - 00 On Mode (CRT interface is active and RAMDAC is full on).....default
 - 01 Standby Mode (Hsync disabled, Vsync active, DAC off, RAMDAC color palette lookup table (LUT) video data path is off but LUT I/O is allowed)
 - 10 Suspend Mode (Vsync disabled, Hsync active, RAMDAC is off but contents are retained)
 - 11 Off Mode (Hsync and Vsync disabled, DAC LUT is full off)

In hardware mode, these bits indicate the status of CRT Hsync and Vsync as well as the internal RAMDAC power state (the “off” mode state can be read only in CRT only mode). In software mode, these bits control the state of the CRT Hsync and Vsync signals but not the power state of the internal RAMDAC. In simultaneous display modes, the power state of the RAMDAC is not controlled by the DPMS Power State (bits 1-0), but by the Chip Power State (bits 6-5).

GR24 – Software Power Control..... RW

- 7 **VCLK**
 - 0 Disable
 - 1 Enable..... default
- 6 **MCLK**
 - 0 Disable
 - 1 Enable..... default
- 5 **CPU & DRAM Data Bus**
 - 0 Disable
 - 1 Enable..... default
- 4 **Reserved**always reads 0
- 3 **ENPBLT (Panel and/or Backlight Enable) Control**
 - Software Power Control
 - 0 Drive ENPBLT Low default
 - 1 Drive ENPBLT High
 - Hardware Power Control (timers, pin, register bit)
 - 0 ENPBLT is active low default
 - 1 ENPBLT is active high
- 2 **Panel VDD**
 - 0 Disable..... default
 - 1 Enable
- 1 **Panel Interface Signals**
 - 0 Disable..... default
 - 1 Enable
- 0 **Panel VEE**
 - 0 Disable..... default
 - 1 Enable

GR25 – Power Control Select..... RW

When any of bits 7-6 or 3-0 are set to 1, the corresponding power control bit reads back the logic state of the internal power management engine. For all bits below, 0 selects hardware power control and 1 selects software power control.

- 7 **Power Control for VCLK**..... def = 1
- 6 **Power Control for MCLK** def = 1
- 5 **Power Control for the Data Bus** def = 1
- 4 **Power Control for the RAMDAC** def = 1
The RAMDAC is software enabled in GR26[7-6]
- 3 **Power Control for Panel Enable / Backlight** def = 1
(see GR24[3])
- 2 **Power Control for Panel VDD** def = 1
- 1 **Power Control for Panel Interface Signals** . def = 1
- 0 **Power Control for Panel VEE** def = 1

GR26 – DPMS Control.....RW

- 7-6 RAMDAC Internal Power Control**
 - 00 Normaldefault
 - 01 DAC off (used in LCD only mode)
 - 10 Standby (DAC off, LUT in low power mode, I/O allowed to LUT). May be used in LUT bypass mode.
 - 11 Suspend (DAC off, LUT access disallowed but LUT contents are preserved)
- 5-4 Reserved** always reads 0
- 3 DPMS Control**
 - 0 Software Control Mode: DPMS controlled by GR23[1-0] in simultaneous display and CRT-only modes (may be used to decouple the power modes of the CRT and LCD during simultaneous display) default
 - 1 Hardware Control Mode: DPMS controlled by internal power states.
- 2-0 Reserved** always reads 0

DPMS Control Modes

DPMS Software Control Mode

In simultaneous display mode, the software control mode can be used to control DPMS low power states independent of the chip power states. In CRT display mode, software mode gives total DPMS control to software. Pseudo-standby may be controlled by bits 7 and 6, as well as BLANK# timing.

DPMS Hardware Control Mode

Table 9. DPMS Sequence - Hardware Timer Mode

Power Level	DPMS Mode
High - Activity detected	On
Moderate - 16 min inactivity	Standby
Low - 32 min inactivity	Suspend
Lowest - 64 min inactivity	Off

DPMS hardware timer mode is defined as CRT only mode with the DPMS control mode bit set to hardware (bit 3 =1). Activity detection is set by register GR21[2:0]. Status is indicated in bits 1 and 0. The timer may be controlled by software from GR20[7].

Table 10. DPMS Sequence - Hardware Mode in Simultaneous Display Mode

Power Level	DPMS Mode
High - Chip on state	On
Moderate - Chip standby	Off
Low - Chip suspend	Off
Lowest - Chip off state	Off
In simultaneous display mode with hardware DPMS set, DPMS states are sequenced by the timer, pin, and register bits that control the chip power states.	

GR28-27 – GPIO Control.....RW

- 15-8 GPIO Direction 7-0**
 - 0 Readdefault
 - 1 Write
- 7-0 GPIO Data 7-0..... default = 0**

GR2A – Suspend Pin TimerRW

Hardware Cursor Registers

The PLE133 supports a Windows® compatible hardware cursor. The hardware cursor operates only in extended planar and packed pixel modes. The cursor size can be selected between 32x32 and 64x64. Two 2-bits-per-pixel images define the cursor shape. The table below shows how these two bits operate on each pixel. The hardware cursor pattern is stored in off-screen memory.

Table 11. Hardware Cursor Pixel Operation

Plane 0 (AND)	Plane 1 (XOR)	Pixel Operation (Windows®)	Pixel Operation (X11)
1	0	Transparent	Cursor BG Color
1	1	VGA Data Inversion	Cursor FG Color
0	1	Cursor FG Color	Transparent
0	0	Cursor BG Color	Transparent

CR43-40 – Hardware Cursor PositionRW

- 31-28 **Reserved** always reads 0
- 27-16 **Hardware Cursor Position Y Dimension**
- 15-12 **Reserved** always reads 0
- 11-0 **Hardware Cursor Position X Dimension**

CR45-44 – Hardware Cursor Pattern LocationRW

- 15-12 **Reserved** always reads 0
- 11-0 **Hardware Cursor Map Mask Storage Location**
1KB aligned in the frame buffer

CR47-46 – Hardware Cursor Offset.....RW

- 15 **Reserved** always reads 0
- 14-8 **Hardware Cursor Position Y-Offset**
- 7 **Reserved** always reads 0
- 6-0 **Hardware Cursor Position X-Offset**

CR4F-48 – Hardware Cursor Color.....RW

- 63-56 **Reserved** always reads 0
- 55-32 **Hardware Cursor Background Color**
- 31-24 **Reserved** always reads 0
- 23-0 **Hardware Cursor Foreground Color**

CR50 – Hardware Cursor Control RW

- 7 **Hardware Cursor Enable**
 - 0 Disable default
 - 1 Enable
- 6 **Hardware Cursor Mode**
 - 0 MS Windows™ Compatible default
 - 1 X11 Compatible
- 5 **Hardware Cursor Color Control 3**

 - 1 Enable
- 4 **Hardware Cursor Color Control 2**
 - 0 Disable default
 - 1 Enable
- 3-2 **Reserved** always reads 0
- 1-0 **Hardware Cursor Size**
 - 00 128x128 default
 - 01 64x64
 - 10 32x32
 - 11 -reserved-

Additional CRTC Extended Registers

CR51 – Bus Grant Termination ControlRW

7-0 Bus Grant Termination Position
This register is active if CR52[6] = 1

CR52 – Shared Frame Buffer Control.....RW

7, 5 Shared Frame Buffer (SFB)
00 Disabledefault
01 Enable SFB slave mode 1 (8ma I/O buffer)
10 Enable SFB master mode
11 Enable SFB slave mode 2 (16ma I/O buffer)

6 Bus Grant Termination Position Control
0 Disabledefault
1 Enable

4 Reserved always reads 0

3-0 Bus Grant Low Pulse (MCLKs) def = 0010b

CR55 – PCI Retry Control.....RW

7 PCI Retry in Memory Write Command
0 Disabledefault
1 Enable

6 PCI Retry in Memory Read Command
0 Disabledefault
1 Enable

5-0 Number of PCICLKs * 2 for STOP# def = 0Fh
Number of PCICLKs, multiplied by 2, for generating STOP# during the first data phase

CR56 – Display Pre-end Fetch Control.....RW

7-2 Reserved always reads 0

1 Display Queue Pre-end Fetch
0 Disabledefault
1 Enable

0 Display Queue Pre-end Fetch Parameter Bit-8
Used with CR57 default = 0

CR57 – Display Pre-end Fetch ParameterRW

7-0 Display Queue Pre-end Fetch Parameter Bit-8
Used with CR56[0]default n/a

CR5E – Capture / ZV Port Control..... RW

7 Capture Idle..... RO

6 Capture Command Port
0 Disable default
1 Enable new command port (2203-2200h)

5-3 Reserved always reads 0

2 PCI I/O Write Retry
0 Disable default
1 Enable

1 PCI I/O Read Retry
0 Disable default
1 Enable

0 Capture Interface
0 Disable default
1 Enable
This bit is protected by SRE_New[7]

CR5F – Test Control..... RW

7 Internal Control Test Output
0 Normal default
1 Internal control signals are output to P15-0

P15 GEREQ
P14 GEBUSY
P13 CMDIN
P12 GEWAIT
P11 CMATCH
P10 KGECYC
P9 WBMT
P8 GERTRY
P7 BLANKTV
P6 WRSTY
P5 WRSTU
P4 WRSTV
P3 WRSTI
P2 YOEN
P1 UEN
P0 YUVEN

6 Capture Input Interrupt Polarity Select
0 Normal default
1 Test data is output to pixel bus P15-0

5-1 Reserved always reads 0

0 Stop DISPQ REQ Test
0 Normal default
1 Stop DISPQ REQ

CR62 – Enhancement 0RW

- 7 Pause GE Operation (GEPAUSE)**
 - 0 Normal GE Operationdefault
 - 1 Pause GE Operation
- 6 PCI Retry for GE (ENGERTRY)**
 - 0 Disabledefault
 - 1 Enable
- 5 Short Command (ENSHRT)**
 - 0 Disabledefault
 - 1 Enable
- 4 Direct Read Even if GE is Busy (ENDIRRD)**
 - 0 Disabledefault
 - 1 Enable
- 3 Reserved** always reads 0
- 2 Low Priority Arbitration Policy**
 - 0 Fixed Priority
 - 1 Round Robindefault
- 1 High Priority Arbitration Policy**
 - 0 Fixed Prioritydefault
 - 1 Round Robin
- 0 Frame Buffer Memory Size Select**
 - 0 8MBdefault
 - 1 4MB

CR63 – Enhancement 1..... RW

- 7-6 Reserved** always reads 0
- 5-4 Memory Folding Control**
 - 00 Normal default
 - 01 FOLD6
 - 10 FOLD7

 - 1 Off
- 6 DPA Bypass**
 - 0 Normal default
 - 1 Bypass
- 5-3 Reference Feedback Clock Delay**
Maximum 2ns default = 0
- 2-0 Reference Internal Clock Delay**
Maximum 2ns default = 0

Video Display and Capture Engine Registers

The PLE133 integrates video display and capture engines, which support YUV 4:2:2, YUV12 (planar) or YUV 4:1:1 data formats to accelerate software playback and video capture functions. Video images can be captured through a special video capture port or the PCI bus. Dual apertures on the PCI bus enable graphics and video data to be transported simultaneously without any software involvement. The video image can be smoothed through a programmable multi-tap filter to reduce the jig-jag effect after minification. The video data can be minified to save bus bandwidth or memory space and written into offscreen memory. The video display engine fetches YUV 4:2:2 or planar video data from offscreen memory and can be scaled up with linear interpolation in both X and Y directions. The video data stream is converted into a True Color RGB24 data stream and multiplexed with the graphics data. Two live video windows can be supported. The graphics data and video data can be handled smoothly in different color depths with color key support. A hardware anti-tear mechanism prevents the tearing effect due to frame buffer update and eases the burden of software to flip the page. Since the hardware synchronizes the capture or PCI video address pointer with the playback VSYNC, the built-in algorithm ensures the playback frame buffer is free from the frame update. For the parameters defined here, refer to the following figures.

Note that W1' is defined for the anti-tearing function. W1 is the first live video storage area and W2 is the second live video storage area. W1 could be in either packed pixel or planar format, while W2 can only be packed pixel mode. If W1 is in packed pixel mode, then W1-U and W1-V are not used. If W1 is in planar mode, then W1-Y is the first live

video Y-component storage area, and W1-U (V) is the first live video U (V) -component storage area. In the following register definitions, a register with W1 (W2) indicates that this parameter is applicable to the first (second) live video window only.

Frame Buffer	Graphics
3D5.94-92	W1 (YUV) W1-Y
3D5.9A-98	W1'
3C5.82-80	W1-U
3C5.85-83	W1-V
3C5.88-86	W2

Figure 7. Frame Buffer Parameters

1: CR92-CR91, 2: 3X58E-CR8D, 3: CR8B-CR8A, 4: CR87-CR86, 5: CR89-CR88, 6: CR8D-CR8C, 7: SR90-SR8F, 8: SR94-SR93

 - 1 Enable
- 11 Window 1 Horizontal Interpolation**
 - 0 Disabledefault
 - 1 Enable
- 10 CSC / Bypass Select**
 - 0 CSCdefault
 - 1 Bypass
- 9 Line Toggle for Line Buffer**
 - 0 Normaldefault
 - 1 Toggle (Reversed)
- 8 Reserved** always reads 0
- 7-5 Window 1 HDEO Delay Adjust**..... default = 4
- 4 Video Window 1**
 - 0 Disabledefault
 - 1 Enable
- 3 CCIR-/ DTV Input Video Data Control**
 - 0 CCIR Format.....default
 - 1 DTV Format
- 2-1 W1 / W2 Line Buffer Page Break Level Control**
 - 00 8 levelsdefault
 - 01 16 levels
 - 1x 32 levels
- 0 Video Window 2**
 - 0 Disabledefault
 - 1 Enable

CR91-90 – Window 1 / W1-Y Row Byte OffsetRW

- 15-14 Reserved** always reads 0
- 13-0 Video Row Byte Offset**
Programmed with the number of bytes in a row

CR94-92 – Window 1 / W1-Y Video Start Address.....RW

- 23-21 Reserved** always reads 0
- 20 Used with CR97 bit-7**
- 19-0 Video Start Address (in bytes)**

CR95 – Video Window Line Buffer Threshold..... RW

- 7 Line Buffer Level Bit-8** (used with CR96)
- 6-0 W1 / W2 Line Buffer Request Threshold Value**
When the line buffer is less than this value, a memory request will be issued. The value programmed in this register must be less than the line buffer level (see bit-7 and CR96).

CR96 – Window 1 / W1-Y Line Buffer Level Control.. RW

- 7-0 Line Buffer Levels** (bit-8 is in CR95[7])
RGB8: (pixel # + 2) / 8 rounded up
YUV 4:2:2: (Pixel # + 2) / 4 rounded up
For W1-U or W1-V, the level is this value divided by 4 or 16, depending on the panar format (YUV12 or YUV9)

CR97 – Video Display Engine Flags RW

- 7 Start Address Reload Control**
 - 0 CR94[4]=0 address can be reloaded any time
 - 1 CR94[4]=0 only reloaded during Vsync
 - x CR94[4]=1 address not reloaded
- 6 Video Start Reference Select**
 - 0 HSYNC / VSYNC..... default
 - 1 Use fixed signals (fixed relationship with HDE and VDE) as video start reference
- 5 Address Point Invert**
 - 0 Normal..... default
 - 1 Invert
- 4 Odd / Even Invert (Anti-tearing)**
 - 0 Normal..... default
 - 1 Invert
- 3 Playback Test Mode Select (RGB Data Select)**
- 2 Playback Test Mode**
 - 0 Disable..... default
 - 1 Enable
- 1 Anti-tearing Sync Select**
 - 0 VGA Vsync default
 - 1 Playback Vsync
- 0 Anti-tearing**
 - 0 Disable..... default
 - 1 Enable

This bit is automatically disabled if there is only one video stream and dual live video mode is enabled. In this mode, the even field is used for one live video stream and the odd field is used for the other live video stream.

CR9A-98 – Capture Video Start Address RW

- 23-20 Reserved**always reads 0
- 19-0 Capture Video Start Address**
Controlled by SRBE (3C5 index BE).

CR9B – Video Display Status..... RWC

- 7 Capture Interrupt**
 - 0 Disabledefault

3D Graphics Engine Registers

This section describes how to program the PLE133 graphics engine for different operations. When the Setup Engine is to be used, the following steps should be taken to perform the drawing functions:

- Software sets up the drawing environment.
- Software issues a drawing command.
- Software continuously sends triangles to Setup engine.
- Software sends a triangle with last flag set or a null triangle to Setup engine to signal end of operation.

Operational Concept

From a programmer's point of view, operations that can be applied to the PLE133 fall into the following categories:

- **Reset:** This operation resets the GE to default status.
- **Status:** This operation returns the GE status.
- **Drawing Environment:** The operations set environment for drawing.
- **Frame Buffer Control:** The operations set control for the frame buffer.
- **Drawing:** Draw an object.
- **Geometry Primitives:** Describe a geometry primitive.

Drawing Environment defines a set of conditions that decide the operations to be applied to each pixel. Drawing Environment operations are straight-forward. There is a group of registers that defines the drawing environment. By directly setting these registers, a program can control the drawing environment.

Frame Buffer Control decides how to access the frame buffer. Like the Drawing Environment, there is a group of registers that define the frame buffer access. By directly setting these registers, a program can control frame buffer access.

Drawing

Bitblt - Frame Buffer to Frame Buffer

Blt operation may involve a pattern. If it does, and the pattern is stored in the frame buffer, the pattern parameters (P1, P2, P3) must also be set. The following registers must be set to provide the source and destination rectangles of blt: Ps1, Pd1, Ps2, and Pd2. These registers can be set in any order. If a register is set several times, only the last one is effective. After all the registers are set, the program starts blting by writing a blt command to Command Register.

Bitblt - CPU to Frame Buffer

The operation for blting from the CPU is similar to the blting from the frame buffer except that Ps1 and Ps2 are not needed and the data from the CPU must immediately follow the setting of the Command Register.

For all commands that require data from the CPU, the command and data are considered atomic; i.e., the data should follow the command immediately and no other command or parameter can be placed in between. The data can be written to Data Register III and IV. Alternatively, it can be written to a memory-mapped space designated by PLE133 apertures. The same rule applies to drawing text from the CPU to the frame buffer.

Text

Text glyph can be from the CPU or the frame buffer. When the glyph is from the CPU, the registers to be set are Pd1 and Pd2 for text location. When the glyph is stored in the frame buffer, the registers to be set are Ps1, Ps2, Pd1, and Pd2 to provide both the glyph and text locations. These registers can be set in any order. If a register is set several times, only the last one is effective. After all the registers are set, the program starts blting by writing a text command to Command Register.

The major difference between text and Blt is that a text source data is 8-bit aligned while the bitblt is 64-bit aligned. That is, for text, each new line starts at the byte boundary, while for a bitblt, at the 64-bit boundary.

A Note on CPU as the Source of Operation

Any operation that uses the CPU as the source of operation (such as the Blt shown in section x) requires the host CPU to feed data into data registers III and IV (BA+56 and 60). Since the PLE133 is using the 64-bit internal data path, any data (32-bit) from the CPU will be packed into 64-bit before use. Therefore, there are two registers for the CPU to write. These two registers are arranged as shown in the following diagram.

Writing to Data Register IV triggers data in both registers to be sent to the engine for processing. However, the hardware may expose the two registers as a mapped space to save software from toggling between the two registers.

Geometry Primitive

To draw a geometry primitive, the host must issue a drawing command by writing to the Command Register first and then set up the geometry as described in later in this document.

Geometry Primitives

The PLE133 supports the following geometry primitives: line, and polygon. Each geometry primitive can be further modified for 3D, shading, and texture mapping. A different mechanism, called sequential loading, performs the geometry primitive set up operation.

Loading Mechanism

There are two ways to set up a geometry primitive, random loading and sequential loading. Like the random access, the order is not important in random loading, but the address is. Writing to a certain address in the register space causes a certain pre-determined action. On the other hand, like sequential access, the order decides the data semantics in sequential loading. The PLE133 uses sequential loading in the Rasterization Engine and the Setup Engine.

In the PLE133, parameters don't have to be the fixed addresses. PLE133 parameters are treated as a data stream and interpreted based on the type of primitive. Parameters must be set in a stream as follows:

Stream Bytes	0	4	4+P1	4+P2	4+Pn
Data	Stream Head	Parameter 1	Parameter 2	Parameter 3	Parameter n+1

P1 is the number of bytes for parameter 1, P2-P1 for parameter 2, etc.

For the Rasterization Engine, there are 9 kinds of parameters: Bresenham Edge, DDA Edge, Z, Texture, Perspective, Color, Specular/fog Start, Specular, and Fog. Parameters must appear in the following order:

Edge(Major), Texture, Perspective, Color, Specular/fog Start, Specular, Fog, Z, Edge(Minor)

There are two kinds of edges and only one kind can appear in a parameter stream. Bresenham Edge can only appear in 2D primitives (without values for iterators).

For the Setup Engine, there is only one kind of parameter: vertex. However, each primitive could have one or three vertices. The size of each vertex is variable depending on triangle attribute.

Only polygon and line primitives can use this sequential loading feature. In the following sections, each primitive is addressed in detail.

Polygon

General polygons can only be drawn by directly using the Rasterization Engine. In the PLE133, all polygons must be Y-monolithic, meaning, when walking from the vertex with minimal Y to the vertex with maximum Y, the Y coordinates of the vertices are monolithically increased. A polygon is drawn by drawing a series of segments:

Sequence	Content
0	Drawing Command (Polygon)
1	Full Polygon Segment
2	Polygon Segment (Full or Partial)
3	Polygon Segment (Full or Partial)
....
n	Polygon Segment (Full or Partial) or a Null Primitive

A partial segment consists of only one primitive type and one minor edge parameter. A full segment consists of one primitive type, edge parameter(s), and interpolation parameters (Z, color, texture, etc.). The rule is whenever a new major edge is in the segment a full segment must be used, otherwise a partial segment has to be used.

Most bit fields in primitive type define the data to be loaded to Rasterization Engine. If the "Re-load" bit is set, they also define the data set to be passed to Pixel Engine. The primitive type of the first and only the first segment must have the "Re-load" bit set to signal Rasterization Engine the data set to be passed to Pixel Engine. The primitive type of the last and only the last segment must have the "Last" bit set to signal the end of the sequence. The last of the primitive can be a Null primitive (others must be polygon). Null primitive has no parameter.

This mechanism can be used to draw a single polygon, as well as multiple polygons with the same attributes (e.g. 3D texture mapped). All that is required is that somewhere in the sequence we pass a full segment with starting edges of a new polygon.

The following example shows how to draw two shaded polygons.

Sequence	Content
0	Drawing Command
1	Full Segment including Primitive Type: Re-loading, Major & minor edge, color Major edge L1 Color Parameter for L1 Minor edge L2
2	Partial Segment including Primitive Type: minor edge Minor Edge L3
3	Full Segment including Primitive Type: Major edge, color Major Edge L4 Color for L4
4	Partial Segment including Primitive Type: Minor edge Minor Edge L5
5	Full Segment including: Primitive Type: Major & minor edge, color, negative scan direction Major edge L6 Color Parameter for L6 Minor edge L7
6	Partial Segment including: Primitive Type: Minor edge, "Last" Minor Edge L8

The following sections are about complete segments (a full segment with both major and minor edges) with different attributes. A normal full segment may not have the minor edge parameter. A partial segment has no other parameters except the minor edge.

5	Perspective Factor Parameter
6	Color Parameter
7	Alpha Parameter (optional)

Triangle

Triangles can be drawn using the Polygon Mechanism described above. Additionally, triangles can also be drawn by using the Setup Engine if they meet certain criteria. Triangles and polygons can also be freely mixed in a drawing sequence. The PLE133 supports stand-alone triangles as well as a triangle list in a sequence as follows:

Sequence	Content
0	Drawing Command (Polygon)
1	Triangle primitive
2	Triangle primitive
3	Triangle primitive
...	...
1	Triangle primitive

Each primitive consists of a triangle attribute and one or three vertices. The order of the data in each primitive is: Triangle Attribute, Vertex 0, Vertex 1 (optional), Vertex 2 (optional). Whether vertices 1 and 2 are to be loaded depends on the Triangle Attribute. Writing to BA+192 triggers a loading sequence in the Setup Engine. The order of the data in a vertex is: Z, RGBA, UV, W, XY. Not every one has to appear in every vertex. Whether a particular item is present in a vertex is decided by the Triangle Attribute. For example, the Data in a stream for a texture mapped triangle strip may look like: Triangle Attribute, U0V0, X0Y0.

Due to the limited precision of the setup engine, only triangles smaller than a certain size will be passed. Software will only pass triangles smaller than 64x128 or 128x64 to the hardware. Also, delta values of RGBAUVZ across a triangle will be less than 128. There is no limitation on the delta of W since it is impossible to exceed 1.

Line

Parameters for line primitives are very similar to their polygon counter-parts. The differences are as follows:

There are only major edge parameters.

All the dXm values (dRm, dUm, etc.) are ignored.

The following example shows these differences for a texture mapped primitive:

Sequence	Polygon Content	Line Content
0	Drawing Command	Drawing Command
1	Primitive Type	Primitive Type
2	Major Edge	Major Edge
3	Texture Parameter	Texture Parameter
4	Minor Edge	

Using the same mechanism for multiple polygons, multiple lines can also be drawn by issuing one drawing command.

Synchronization

Reset and status operations can be performed in any order and at any time including in the middle of another operation. However, be aware of the consequence (reset) and what to expect (status).

Generally, Drawing Environment and Frame Buffer Control operations should be performed before the drawing operation to take effect.

The primitive operation is considered atomic; i.e., no other operation (except for status and reset) can be performed inside a Geometry Primitive operation.

Functional Blocks

The PLE133 hardware is divided into 6 major functional blocks. They are:

- Bus Interface (BI)
- VGA core (VGA)
- Setup Engine (SE)
- Rasterization Engine (RE)
- Pixel Engine (PE)
- Memory Interface (MI)

Each functional block conceptually works independently of other blocks. The term "Graphics Engine (GE)" indicates the combination of the Setup Engine, the Rasterization Engine, and the Pixel Engine.

Bus Interface

The bus interface block connects the AGP bus on one side and the GE and VGA on the other side.

Span Engine

PS1, PS2, PD1, and PD2 are used in blt and text operations to define source and destination rectangles.

GEbase + 0 - Parameter Source 1.....RW

- 31-28 Reserved** always reads 0
- 27-16 Y-coordinate Parameter Source 1 Start**
High 12 bits of parameter source 1 starting address in Y coordinate
- 15-12 Reserved** always reads 0
- 11-0 X-coordinate Parameter Source 1 Start**
Low 12 bits of parameter source 1 starting address in X coordinate

GEbase + 4 - Parameter Source 2.....RW

- 31-28 Reserved** always reads 0
- 27-16 Y-coordinate Parameter Source 2 Start**
High 12 bits of parameter source 2 starting address in Y coordinate
- 15-12 Reserved** always reads 0
- 11-0 X-coordinate Parameter Source 2 Start**
Low 12 bits of parameter source 2 starting address in X coordinate

GEbase + 8 - Parameter Destination 1..... RW

- 31-28 Reserved**always reads 0
- 27-16 Y-coordinate Parameter Destination 1 Start**
High 12 bits of parameter destination 1 starting address in Y coordinate
- 15-12 Reserved**always reads 0
- 11-0 X-coordinate Parameter Destination 1 Start**
Low 12 bits of parameter destination 1 starting address in X coordinate

GEbase + C - Parameter Destination 2..... RW

- 31-28 Reserved**always reads 0
- 27-16 Y-coordinate Parameter Destination 2 Start**
High 12 bits of parameter destination 2 starting address in Y coordinate
- 15-12 Reserved**always reads 0
- 11-0 X-coordinate Parameter Destination 2 Start**
Low 12 bits of parameter destination 2 starting address in X coordinate

Graphics Engine Core

GEbase + 10 - Right View Display Base Address.....RW

31 Right View Active

- 0 Inactive (use VGA style for display start address).....default
- 1 Active (use the base register address in this register for the display starting address)

30-24 Reserved always reads 0

23-0 Right View Display Starting Address

Writing to this register sets Status Register bit-21 to 0. Later when the address is used to display a frame, the status bit is changed to 1.

GEbase + 14 - Left View Display Base AddressRW

31 Left View Active

- 0 Disable (only Right View Display Starting Address is used).....default
- 1 Enable (Right View Display Starting Address is used for the right view and this register for the left view; hardware will use these two addresses alternately)

30-24 Reserved always reads 0

23-0 Left View Display Starting Address

Writing to this register sets Status Register bit-20 to 0. Later when the address is used to display a frame, the status bit is changed to 1.

GEbase + 18 – Block Write Start Address RW

31 Linear Mode

- 0 Fill a rectangle area default
- 1 Fill a linear area

30-24 Reservedalways reads 0

23-0 Starting Address (in multiples of 64 bytes)

GEbase + 1C – Block Write Area / End Address..... RW

Rectangle Area Fill Mode

31-28 Reservedalways reads 0

27-16 Height of the Area

15-12 Reservedalways reads 0

11-0 Width of the Area (in bytes)

Stride is Destination Stride in port 21C0h

Linear Area Fill Mode

31-0 End Address (in multiples of 64 bytes inclusive)

Writing to this register triggers a Memory Set operation. Color for this operation is specified in the Foreground register.

GEbase + 20 – Graphics Engine Status.....RO

Writing to this register resets the GE.

- 31 Bresenham Engine Status**
 - 0 Idle
 - 1 Busy
- 30 Setup Engine Status**
 - 0 Idle
 - 1 Busy
- 29 SP / DPE Status**
 - 0 Idle
 - 1 Busy
- 28 Memory Interface Status**
 - 0 Idle
 - 1 Busy (access for screen refresh doesn't count)
- 27 Command List Processing Status**
 - 0 Idle
 - 1 Busy
- 26 Block Write Status**
 - 0 Idle
 - 1 Busy
- 25 Command Buffer Status**
 - 0 Not full
 - 1 Full
- 24 Reserved** always reads 0
- 23 PCI Write Buffer Status**
 - 0 Empty
 - 1 Not empty
- 22 Z Check Status**
 - 0 Engine busy: All Z tests performed so far have failed in the command being executed.
Engine idle: All Z tests performed in the last command have failed.
 - 1 Otherwise

Logically, this bit is the OR of all Z test results performed in the latest command
- 21 Effective Status**
 - 0 Current display base register is not yet effective (the frame is not displayed)
 - 1 It is effective
- 20 Left View Status**
 - 0 Current display base register is not yet effective (the frame is not displayed)
 - 1 It is effective
- 19 Last View Displayed / Being Displayed**
 - 0 Right View
 - 1 Left View
- 18-11 Reserved** always reads 0
- 10-0 Scan Line Currently Being Displayed**

There are two input FIFOs to buffer data and commands from the host, the Command FIFO (8 levels deep) and the Bresenham FIFO (2 levels deep). Drawing commands, Drawing Environment, and Frame Buffer Control are routed through the Command FIFO. Primitive Type and Geometry Primitives are routed through the Bresenham FIFO. Commands in the Command FIFO don't take effect until a prior command is executed or the task in progress is finished. Parameters in the Bresenham FIFO don't take effect until a prior parameter is phased out (reaches the end of an edge).

GEbase + 24 – Graphics Engine ControlWO

- 7 Reset**
 - 0 Normal operationdefault
 - 1 Reset all internal registers and pointers. Reset is performed by setting this bit to 1 and then back to 0.
- 6-4 Reserved** always reads 0
- 3-0 Debug Module Select** default = 0

<u>Module to Debug</u>	<u>GE Register 28</u>
000 None	undefined
001 Setup Engine	SE Status
010 Rasterization Engine	RE Status
011 Pixel Engine	PE Status
100 Memory Interface	MI Status
101 Cmd List Ctrl Unit	Cmd List Start Address
110 Cmd List Ctrl Unit	Cmd List End Address
111 -reserved-	n/a

GEbase + 28 – Graphics Engine DebugRO

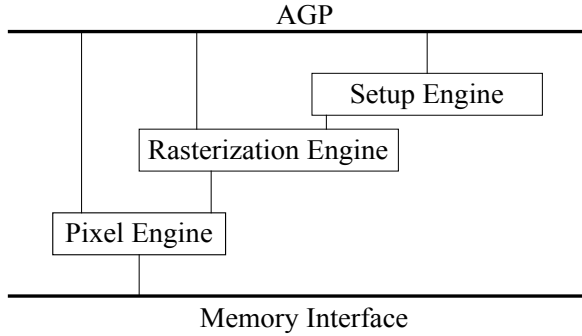

- 31-0 Engine Module Status**
(See register 24 bits 3-0 above)

GEbase + 2C – Graphics Engine Wait Mask RW

- 31-0 Wait Mask**
When writing to this register, hardware will monitor the value of M (Wait Mask & Status). If M is not 0, the Graphics Engine (including the RE, SE, PE, and MI) will not accept new registers from the host CPU or AGP bus. This register is cleared by the hardware when M = 0. Only bits 31-28, 26, 23, and 21-20 are effective (all other bits are ignored).

Graphics Engine Organization

The PLE133 Graphics Engine consists of the following units: Setup Engine, Rasterization Engine, and Pixel Engine. These units are organized as follows:

The interfaces among the components are:

- AGP to Pixel Engine: Set drawing environment registers.
- AGP to Rasterization Engine: Set primitives: edge walking, slopes.
- AGP or Setup Engine: Set vertices, culling info.
- Setup Engine to Rasterization Engine: Set primitives: edge walking, slopes.
- Rasterization Engine to Pixel Engine: Pixel Data, addresses and coordinates.
- Pixel Engine to Memory Interface: Addresses and coordinates, pixel data.

Each unit performs the following functions:

- Setup Engine: Back face culling, slope calculation.
- Rasterization Engine: Edge walking, color interpolation, Z, texture coordinates, perform perspective correction.
- Pixel Engine: Generate addresses and coordinate for all memory accesses: read/write Z, read texture, read source/destination, write destination (draw buffer), 2-D functions, bi/tri-linear interpolation, blending and modulation, ROP, Z test, alpha test, transparency, etc.

When the Setup Engine is to be used, the following steps should be taken to perform drawing functions:

- S/W sets up the drawing environment.
- S/W issues a drawing command.
- S/W continuously sends triangles to the Setup Engine (or primitives to the Rasterization Engine).
- S/W sends a triangle with last flag set or a null triangle to the Setup Engine to signal the end of the operation (or its equivalent to the Rasterization Engine).

Triangles sent to the Setup Engine can be interleaved with primitives sent to the Rasterization Engine in step 3 above.

The Setup Engine uses the same sequential loading mechanism as in the Rasterization Engine. The order of loading is: Triangle Attribute, Vertex 0, Vertex 1 (optional), Vertex 2 (optional). Whether vertex 1 and 2 are to be loaded depends on the Primitive Type. Writing to BA+4Ch triggers a loading sequence to the Setup Engine. The order of data in a vertex is: RGBA, SrgbF, W, UV, Z, XY. Not every one will appear in every vertex. Whether a particular item will be present in a vertex is decided by the Triangle Attribute. For example, the data in a stream for a texture mapped triangle strip may look like: Triangle Attribute, U0V0, X0Y0.

GEbase + 2C – Setup Engine Status RO

31-0 Overflow Status

This register records setup engine overflow status. For every triangle, the entire register is shifted left one bit with bit-0 then set to reflect whether the triangle has slope overflow. This register is useful for debugging purposes. This register resides in the VGA address space and is not decoded by the setup engine.

|---|--|

This register is decoded by the Setup Engine and passed to the Rasterization Engine by the Setup Engine. This register and its equivalent part in the Rasterization Engine are “partially” pipelined in the sense that there are only two levels of pipe for this register in both engines while there are many levels for other data. The two levels are the decoding level and the execution level. Both the Rasterization Engine and the Setup Engine use this register to decide what kind of operation to perform and what kind of data stream to expect. It must be set before any parameter can be loaded.

GEbase + 3C –Setup Engine Primitive Type.....WO

Writing to this register signals the Graphics Engine to begin sequential loading. The engine will interpret the contents of this register and the Primitive Attribute register to decide the amount and types of parameters to expect. Like vertices, there is a FIFO for Triangle Attributes. The queue has three entries. Writing to this register adds it to the queue. The Setup Engine starts working whenever a triangle attribute is received and stops after it is finished processing a triangle with L = 1.

31-30 Loading Target

- 00 Rasterization Engine. Send bits 19-0 to the RE. Sequential loading data will also be sent to the REdefault
- 01 Setup Engine. Send bits 29-0 to the SE. Sequential loading data will also be sent to the SE. Internally, a flag is set to prevent the SE from decoding the data and sending it to the RE. The SE will clear this flag when it is idle.

- 10 Counter-clockwise culling
- 11 No culling

25 Reserved always reads 0

24 (V2, V0) Edge Anti-Aliasing Flag default = 0

23 (V1, V2) Edge Anti-Aliasing Flag default = 0

22 (V1, V1) Edge Anti-Aliasing Flag default = 0

21 Full Vertices Information

- 0 Partial Vertices Information. Two of the vertices are from the previous triangle. Only one vertex is to be loaded from the vertex queue to the working registers.default
- 1 All vertices are new. All three working registers are to be loaded from the vertex queue.

20-19 Working Vertex Index

Index of the working vertex that is to be replaced. This field is always 0 if F = 1.

18-3 Reserved always reads 0

2 Debug Control

- 0 Discard triangle on overflowdefault
- 1 Draw triangle on overflow

1-0 Flat Color Vertex Index

Vertex index for flat color (Index of vertex whose color is passed to the RE as the starting color)

Vertex Registers

Inside the setup engine, one set of registers is provided to store the three vertices is currently working on and an additional set is provided to store three pending vertices. Note that it doesn't always require 3 vertices to define a triangle (depending on the Triangle Attribute Register, it may be either 1 or 3 vertices).

Vertex information includes coordinate, texture, color, and depth. Some may be absent in a data stream. If any appear in a vertex, they must be present in the following order: Color, Specular Color, W, U, V, Z, X, Y. The formats are shown below:

Vertex Register 1 - Color Value

- 31-24 Alpha Value**
- 23-16 Red Value**
- 15-8 Green Value**
- 7-0 Blue Value**

Vertex Register 2 - Specular Color Value

- 31-24 Fog Value**
- 23-16 Specular Red Value**
- 15-8 Specular Green Value**
- 7-0 Specular Blue Value**

Vertex Register 3 - W Value

- 31-0 Texture W Coordinate.** 32-bit floating # in (0, 1.0)

Vertex Register 4 - U Value

- 31-0 Texture U Coordinate.** 32-bit floating number

Vertex Register 5 - V Value

- 31-0 Texture V Coordinate.** 32-bit floating number

Vertex Register 6 - Z Value

- 31-0 Z Coordinate.** 32-bit floating number

Vertex Register 7 - X Value

- 31-0 X Coordinate.** 32-bit floating number

Vertex Register 8 - Y Value

- 31-0 Y Coordinate.** 32-bit floating number

Floating Point Number Format

All floating point numbers are converted by on-chip hardware into internal fixed point integer format. All floating point numbers are specified in IEEE 32-bit floating point number format (shown below):

- 31 Sign**
- 30-23 Exponent** (excess-127 format)
- 22-0 Mantissa** (fractional part of a number in "1.nn" format where the integer part is always 1)

Rasterization Engine Registers

The major responsibilities of the Rasterization Engine are:

- Receive data from host: Set registers, sequential loading of parameters.
- Edge walking: Generate end points of polygon edges or pixels on a line.
- Interpolation: Calculate values such as texture coordinates on a polygon / line.
- Perspective correction: Perform perspective correction.

In the PLE133, the Rasterization Engine performs color (including alpha) interpolation, texture coordinate (perspective corrected) generation, Z coordinate interpolation, and texture gradient (perspective corrected) calculations.

Host access to the Rasterization Engine is by sequential writes to minimize AGP bandwidth requirements. This is not needed for the Setup Engine to access the Rasterization Engine. In addition, if sequential parameters were used to interface between the Setup Engine and the Rasterization Engine, it would incur extra cost for the Setup Engine to pack data and would also reduce performance. Therefore, the Setup Engine accesses working registers in the Rasterization Engine directly. To synchronize operation, hardware must wait until the Setup Engine becomes idle to accept data from the host to the Rasterization Engine.

Both Rasterization and Setup Engines share one interface to the AGP Write Buffer. The first reason is that both Rasterization Engine and Setup Engine use stream decoding to receive data from the host. Once they are inside a stream, they must act quickly to grab data to prevent other components from taking the data. Having two stream decoders in the graphics engine is a potential source for problems. The second reason is that both the Rasterization Engine and Setup Engine handle the same types of data. Coupling them tightly makes the design easier and reduces problems that arise from synchronization. The third reason is for better synchronization between the two engines.

The engine interfaces to the host through both random access registers and sequential loading. There are two random access registers: Primitive Attribute and Primitive Type. The Primitive Attribute register consists of most parameter information from the Rasterization Engine's Primitive Type and the Setup Engine's Triangle Attribute register.

The address space that can be used by sequential loading parameters is from Base Address + 40h to Base Address + FFh. Software should not use addresses outside this space for parameters. **Sequential loading must use the address in this space starting at 0x40H in ascending order.** For example, the first address must be 40h, the next must be 44h, etc. In order to give time to notify the other component to stop decoding, **address 40h is exclusively reserved for sequential loading.**

21 Scan Direction

- 0 Positive (Major edge = left edge).....default
- 1 Negative (Major edge = right edge)

20-16 Reserved always reads 0

15-0 End Coordinate default = 0
End coordinate of the primitive (inclusive). 12.4 signed integer.

Bresenham Edge Parameters

Bresenham Edge parameters describe an edge of a primitive or a line.

DoubleWord 0 – Start Coordinates

31-16 Start YS1

Starting coordinate of the line in the Y direction (signed 12.4 number). The fractional part must be 0. This parameter is ignored in minor edges.

15-0 Start XS1

Starting coordinate of the line in the X direction (signed 12.4 number). The fractional part must be 0.

DoubleWord 1 – Drawing Direction / Bresenham Constant

31 YS Drawing Direction

- 0 Positive
- 1 Negative

30 XS Drawing Direction

- 0 Positive
- 1 Negative

29 Swap

- 0 Normal (X / Y not swapped)
- 1 X / Y swapped

28-16 Bresenham (or Modified) Constant

15-13 Reserved ignored

12-0 Bresenham (or Modified) Constant

DoubleWord 2 – Error Term / Strip Length

31-29 Reserved must be written as zero

28-16 Initial Error Term

15-12 Reserved must be written as zero

11-0 Strip Length

Strip length of modified Bresenham line.

DDA Edge Parameters

DDA Edge parameters describe an edge of a primitive or a line.

DoubleWord 0 – Start Coordinates

31-16 Start YS1

Starting coordinate of the line in the Y direction (signed 12.4 number). The fractional part must be 0. This parameter is ignored in minor edges.

15-0 Start XS1

Starting coordinate of the line in the X direction (signed 12.4 number). The fractional part must be 0.

DoubleWord 1 – Drawing Direction / Edge Slope

31 YS Drawing Direction

- 0 Positive
- 1 Negative

30 XS Drawing Direction

- 0 Positive
- 1 Negative

29 Swap

- 0 Normal (X / Y not swapped)
- 1 X / Y swapped

28-26 Reserved ignored

25-0 Edge Slope

12.14 signed number

When a DDA edge is used as a polygon boundary, the fractional bits should round up to the next integer. Interpolation values should be adjusted accordingly. DDA edge walking shares the same logic as Bresenham edge walking by using an error advance method. In DDA walking, fractional bits should be rounded up to the next integer. Rounding up is performed by changing drawing convention according to whether the fractional parts are 0 as follows:

- Left fractional is 0: Left inclusive.
- Left fractional is not 0: Left exclusive.
- Right fractional is 0: Right exclusive.
- Right fractional is not 0: Right inclusive.

Because the error advance method is used for DDA walking, the fractional part is always one step ahead of the coordinate. For the starting point of a line, the fractional part is assumed to be 0.

Color Parameters

Color parameters are used for Gouraud shading. They consist of starting values, incremental along the X and Y axis. **In flat color mode, this parameter only has the starting value.**

DoubleWord 0 – Initial Values

31-24 Initial Alpha Value

Initial Alpha value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

23-16 Initial Red Value

Initial Red value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

15-8 Initial Green Value

Initial Green value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

7-0 Initial Blue Value

Initial Blue value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

DoubleWord 1 – X-Axis Blue Gradient

31-0 X-Axis Blue Gradient

Gradient of Blue along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 2 – Y-Axis Blue Gradient

31-0 Y-Axis Blue Gradient

Gradient of Blue along the Y axis over the primitive surface. Signed 20.12 number.

DoubleWord 3 – X-Axis Green Gradient

31-0 X-Axis Green Gradient

Gradient of Green along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 4 – Y-Axis Green Gradient

31-0 Y-Axis Green Gradient

Gradient of Green along the Y axis over the primitive surface. Signed 20.12 number.

DoubleWord 5 – X-Axis Red Gradient

31-0 X-Axis Red Gradient

Gradient of Red along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 6 – Y-Axis Red Gradient

31-0 Y-Axis Red Gradient

Gradient of Red along the Y axis over the primitive surface. Signed 20.12 number.

DoubleWord 7 – X-Axis Alpha Gradient

31-0 X-Axis Alpha Gradient

Gradient of Alpha along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 8 – Y-Axis Alpha Gradient

31-0 Y-Axis Alpha Gradient

Gradient of Alpha along the Y axis over the primitive surface. Signed 20.12 number.

Z Value Parameters

To the Rasterization Engine, the Z value is always a 25.8 signed integer internally regardless of Z buffer depth. It always passes a 24-bit unsigned integer to the Pixel Engine. It is the Pixel Engine's responsibility to scale Z to the depth of the Z buffer. Z parameters are used to calculate depth information. Z values consist of starting values, incremental along the X and Y axis.

DoubleWord 0 – Initial Z Value

31-0 Initial Z Value

Initial Z value on main edge (left edge of trapezoid or long edge of triangle). Signed 25.7 integer.

DoubleWord 1 – X-Axis Z Gradient

31-0 X-Axis Z Gradient

Gradient of Z along the X axis over the primitive surface. Signed 25.7 number.

DoubleWord 2 – Y-Axis Z Gradient

31-0 Y-Axis Z Gradient

Gradient of Z along the Y axis over the primitive surface. Signed 25.7 number.

DoubleWord 3 – Minimum Z Threshold

31-24 Reserved ignored

23-0 Minimum Z Threshold

Minimum of Z threshold. Unsigned 24-bit integer.

DoubleWord 4 – Maximum Z Threshold

31-24 Reserved ignored

23-0 Maximum Z Threshold

Maximum of Z threshold. Unsigned 24-bit integer.

Texture Coordinate Parameters

Texture parameters are used for texture mapping. They consist of starting values, incremental along the X and Y axis.

DoubleWord 0 – Initial U Value
31-0 Initial U Value

Initial U value on main edge (left edge of trapezoid or long edge of triangle). Signed 16.16 integer.

DoubleWord 1 – Initial U Value
31-0 Initial U Value

Initial U value on main edge (left edge of trapezoid or long edge of triangle). Signed 16.16 integer.

DoubleWord 2 – X-Axis U Gradient
31-0 X-Axis U Gradient

Gradient of U along the X axis over the primitive surface. Signed 16.16 number.

DoubleWord 3 – Y-Axis U Gradient
31-0 Y-Axis U Gradient

Gradient of U along the Y axis over the primitive surface. Signed 16.16 number.

DoubleWord 4 – X-Axis V Gradient
31-0 X-Axis V Gradient

Gradient of V along the X axis over the primitive surface. Signed 16.16 number.

DoubleWord 5 – Y-Axis V Gradient
31-0 Y-Axis V Gradient

Gradient of V along the Y axis over the primitive surface. Signed 16.16 number.

Perspective Factor Parameters

Perspective factor parameters are used for perspective corrected texture mapping. They consist of W starting values incremental along the X and Y axis.

DoubleWord 0 – Initial W Value
31-0 Initial W Value

Initial W value on main edge (left edge of trapezoid or long edge of triangle). Signed 4.28 integer.

DoubleWord 1 – X-Axis W Gradient
31-0 X-Axis W Gradient

Gradient of W along the X axis over the primitive surface. Signed 4.28 number.

DoubleWord 2 – Y-Axis W Gradient
31-0 Y-Axis W Gradient

Gradient of W along the Y axis over the primitive surface. Signed 4.28 number.

Specular / Fog Start Value

The specular / fog start value is used for specular shading or fogging.

DoubleWord 0 – Start Value
31-24 Initial Fog Value

Initial Fog value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

23-16 Initial Red Value

Initial Red value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

15-8 Initial Green Value

Initial Green value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

7-0 Initial Blue Value

Initial Blue value on main edge (left edge of trapezoid or long edge of triangle). Unsigned integer.

Specular Parameters

Specular parameters are used for specular shading. These parameters are not present in flat color mode and consist of starting values incremental along the main direction ((dx, dy) = (M1, 1)), and incremental along the X axis.

DoubleWord 0 – X-Axis Blue Gradient
31-0 X-Axis Blue Gradient

Gradient of Blue along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 1 – Y-Axis Blue Gradient
31-0 Y-Axis Blue Gradient

Gradient of Blue along the Y axis over the primitive surface. Signed 20.12 number.

DoubleWord 2 – X-Axis Green Gradient
31-0 X-Axis Green Gradient

Gradient of Green along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 3 – Y-Axis Green Gradient
31-0 Y-Axis Green Gradient

Gradient of Green along the Y axis over the primitive surface. Signed 20.12 number.

DoubleWord 4 – X-Axis Red Gradient
31-0 X-Axis Red Gradient

Gradient of Red along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 5 – Y-Axis Red Gradient
31-0 Y-Axis Red Gradient

Gradient of Red along the Y axis over the primitive surface. Signed 20.12 number.

Fog Parameters

Fog parameters are used for fogging. These parameters are not present in flat color mode and consist of starting values incremental along the X and Y axis.

DoubleWord 0 – X-Axis Fog Gradient
31-0 X-Axis Fog Gradient

Gradient of Fog along the X axis over the primitive surface. Signed 20.12 number.

DoubleWord 1 – Y-Axis Fog Gradient
31-0 Y-Axis Fog Gradient

Gradient of Fog along the Y axis over the primitive surface. Signed 20.12 number.

Pixel Engine Registers

The major responsibilities of the Pixel Engine are to perform per-pixel operations and to control data flow and its sequence.

The Pixel engine interfaces to the Rasterization Engine and the host to accept data. It also interfaces to the Memory Interface to access video memory. Inside the Pixel Engine, there are several blocks: the Span Engine, the Data Path, and the Texture Engine. Operation of the Data Path and the Texture Engine are under control of the Span Engine. The Memory Interface accepts memory access requests from the Pixel Engine, translates the address into a linear address, and executes the requests.

The 0 - FFh “Engine” register address space is partitioned into six sections:

- 0 - 0Fh Span Engine
- 10 - 2Fh VGA core
- 30 - 3Fh Unified Rasterization and Setup Engines
- 44 - 9Fh Pixel Engine
- A0 – AFh Texture Engine
- B0 – BFh Command List Control Unit
- C0 – FFh Memory Interface

Addresses 40h - FFh are also used for sequential loading overlapping with other registers in this space. Addresses 10000 - 1FFFFh are used as a data port area.

Data from the Host

The Pixel Engine can accept data from the host through either the 32-bit data port register at 9Ch or data in the 1xxxh address space. **Software passes only enough DWORDs to hardware. Software doesn't pack data to 64-bit boundaries. It only packs to 32-bit boundaries.** For bitblts, packing is done per-scanline. I.e., for every scanline, the host will send just enough DWORDs to the engine. For text, packing is done per-command. I.e., the scanline may be broken inside a DWORD. For a string of texts, the number of DWORDs of data passed to the Graphic Engine can be odd numbers except for the last character. For the last character, software should pass either an even number of DWORDs (by padding a garbage DWORD as necessary) or by setting a drawing environment register after all data is sent.

GEbase + 44 – Drawing CommandRW

Writing to the Drawing Command register starts a drawing operation. When this register is set, the drawing environment registers and memory interface registers are locked in. Any change to these registers will not affect this drawing operation. Furthermore, the Pixel Engine will not accept any data from the host or from the Rasterization Engine without a drawing command. After a drawing command is issued, the Pixel Engine will selectively accept data from the host or Rasterization Engine depending on the command. Specifically, the Pixel Engine only accepts data from the host if the command is text or blt and the BS field indicates the source is from the host. The Pixel Engine only accepts data (scanlines, Z, color, etc.) from the Rasterization Engine if the command is line or polygon.

 - 1 Enable (bits 26-21 must be 0)
- 19 Source Color**
 - 0 Transparent (applies to mono source and constant color line)
 - 1 Opaque (should be enabled for any operation with a “solid Source”, such as Gouraud shading, constant color fill, color to screen blt, texture mapping, etc.)
- 18-17 Source Surface ID**
- 16-15 Destination Surface ID**
- 14-12 Source Offset**
Mono source pixel offset. Bit-19 must be 1.
- 11 Double Specular Color**
 - 0 Disable
 - 1 Enable. Specular color (RGB) is doubled before being added to diffuse color.
- 10 Texture Transparency**
 - 0 Disable texture color key
 - 1 Enable texture color key
- 9 Lit-Texture**
 - 0 Disable
 - 1 Enable
- 8 Dither**
 - 0 Disable
 - 1 Enable. Use 4x4 dither matrix (including fog and alpha)
- 7 Source Color Key**
 - 0 Disable
 - 1 Enable (Key is FG)
- 6 Destination Color Key**
 - 0 Disable
 - 1 Enable
- 5 Bit Mask**
 - 0 Disable
 - 1 Enable
- 4 ROP**
 - 0 Disable
 - 1 Enable
- 3-2 Blt Source or Constant Color Line or Polygon**
 - 00 Source from host (bits 26-20 must be 0 for blt)
 - 01 Source from frame buffer
 - 10 Source is constant (FG). Includes constant line and constant polygon.
 - 11 Block write fill

This field must be set to 00 for text / line / polygon.
- 1 Blt Direction (BLT Only)**
 - 0 Positive direction in X and Y
 - 1 Negative direction in X and Y

Must be set to 0 for polygons, lines, and text.
- 0 Clipping**
 - 0 Disable
 - 1 Enable

GEbase + 48 – Raster Operation (ROP).....RW

- 31-8 **Reserved** always reads 0
- 7-0 **ROP3 Code**

GEbase + 4C – Z Function..... RW

- 31 **Z-Bias**
 - 0 Disable
 - 1 Enable
- 30-17 **Reserved** always reads 0
- 16-7 **Z-Bias Value**
- 6 **Test Alpha**
 - 0 Disable
 - 1 Enable
- 5 **Z-Buffer Write**
 - 0 Disable
 - 1 Enable
- 4-3 **Reserved** always reads 0
- 2-0 **Z-Buffer Compare**
 - 000 Compare False. Z and RGB values will not be written to memory.
 - 001 Compare Less Than. Z and RGB values will be written to memory if the current Z value is less than the Z value in memory.
 - 010 Compare Equal. Z and RGB values will be written to memory if the current Z value is equal to the Z value in memory.
 - 011 Compare Less Than or Equal. Z and RGB values will be written to memory if the current Z value is less than the Z value in memory.
 - 100 Compare Greater Than. Z and RGB values will be written to memory if the current Z value is greater than the Z value in memory.
 - 101 Compare Not Equal. Z and RGB values will be written to memory if the current Z value is not equal to the Z value in memory.
 - 110 Compare Greater Than or Equal. Z and RGB values will be written to memory if the current Z value is greater than or equal to the Z value in memory.
 - 111 Compare True. Z and RGB values will be written to memory.

GEbase + 50 – Texture FunctionRW

- 31-22 **Maximum U**
- 21-12 **Minimum U**
- 11-5 **Reserved** always reads 0
- 4 **Mask**
 - 0 Disable
 - 1 Enable
- 3-2 **Texture Alpha**
 - 00 Texel alpha
 - 01 Source alpha
 - 10 Modulated alpha: texel alpha x source alpha
 - 11 -reserved-
- 1-0 **Texture Color**
 - 00 Texel color
 - 01 Source color
 - 10 Modulated color: texel color x source color
 - 11 -reserved-

GEbase + 54 – Clipping Window 0.....RW

- 31-28 **Reserved** always reads 0
- 27-16 **Clipping Window Top** default = 0
- 15-12 **Reserved** always reads 0
- 11-0 **Clipping Window Left** default = 0

GEbase + 58 – Clipping Window 1.....RW

- 31-28 **Reserved** always reads 0
- 27-16 **Clipping Window Bottom** default = 0
- 15-12 **Reserved** always reads 0
- 11-0 **Clipping Window Right** default = 0

GEbase + 60 – Color 0 (Foreground)..... RW

- 31-0 **Foreground Color Value**

GEbase + 64 – Color 1 (Background) RW

- 31-0 **Background Color Value**

Note: In 16- and 8- bit modes, the color must be duplicated to fill an entire 32-bit word. 32-bit color is in ARGB format (i.e., Alpha, Red, Green, and Blue in bytes 3-0 respectively) and 16-bit color is in RGB 565 format (5 bits of Red, 6 bits of Green, and 5 bits of Blue).

GEbase + 68 – Color Key..... RW

- 31-26 **Reserved** always reads 0

- 25 **Destination Polarity**
 - 0 Draw on Equal
 - 1

- 24 **Source Polarity**
 - 0 Draw on Equal
 - 1

- 23-0 **Destination Color Key Color**
Unlike foreground and background, the color is not replicated in 16-bit or 8-bit modes.

GEbase + 6C – Pattern and Style.....RW

- 31 Pattern Color Expansion**
 - 0 Disabledefault
 - 1 Enable
- 30 Pattern Transparency**
 - 0 Opaquedefault
 - 1 Transparent
- 29 Pattern Size**
 - 0 8 x 8 pixelsdefault
 - 1 32 x 32 pixels (mono only)
- 28 Pattern Register Segment**
 - 0 Low Segmentdefault
 - 1 High Segment

Note: The pattern cache is divided into two segments for double pattern purposes. This bit serves two purposes: First as the starting segment for loading a pattern into the pattern cache, the corresponding address is latched into an internal register which will automatically increase by one when data is loaded. Second as the segment base of the current pattern when applying a pattern.

27-24 Reserved always reads 0

23-16 Pattern Style Step

The # of pixels each mask bit should be mapped to:

- 00 1 Pixel per mask bit.....default
- 01 2 pixels per mask bit
- 02 3 pixels per mask bit
- ...
- FF 256 pixels per mask bit

15-0 Pattern Style Mask

Determines the line drawing style (e.g., dotted line). Bit-0 maps to the first pixel. Writing to the low byte of this register (GEbase + 6C) causes the internal style count to be reset to 0. When 3D operations are enabled (smooth shading, texture, Z), style line must be transparent and style applies to color as well as Z.

GEbase + 70 – Pattern Color.....RW

31-0 Pattern Color Value

Must follow the command. The pattern data could be repeated up to 64 times to fill out the pattern register file.

GEbase + 74 – Pattern Foreground Color..... RW

31-0 Foreground Color Value..... default = 0

GEbase + 78 – Pattern Background Color..... RW

31-0 Background Color Value..... default = 0

Note: In 16- and 8- bit modes, the color must be duplicated to fill an entire 32-bit word. 32-bit color is in ARGB format (i.e., Alpha, Red, Green, and Blue in bytes 3-0 respectively) and 16-bit color is in RGB 565 format (5 bits of Red, 6 bits of Green, and 5 bits of Blue).

GEbase + 7C – Alpha.....RW

- 31-16 **Reserved** always reads 0
- 15-8 **Source Constant Alpha**
- 7-0 **Destination Constant Alpha**

GEbase + 84 – Bit MaskRW

- 31-0 **Bit Mask**
One bits indicate that the corresponding color bit will not be written to the frame buffer.

GEbase + 80 – Alpha Function..... RW

- 31-24 **Reserved** always reads 0
- 23 **Alpha Write**
 - 0 Disable..... default
 - 1 Enable. Draw each pixel with a blended alpha value if alpha blending is enabled. Otherwise draw with source alpha (the upper byte of the Foreground Color register if not available).
This bit should be set in 8-bit and 16-bit color modes.
- 22 **Constant Source Alpha**
 - 0 Disable default
 - 1 Enable
- 21 **Constant Destination Alpha**
 - 0 Disable default
 - 1 Enable
- 20 **Result Alpha**
 - 0 The result of blending default
 - 1 Source alpha
- 19-16 **Alpha Test Function**
 - 0000 Never accept the pixel
 - 0001 Accept if alpha < reference alpha
 - 0010 Accept if alpha == reference alpha
 - 0011 Accept if alpha <= reference alpha
 - 0100 Accept if alpha > reference alpha
 - 0101 Accept if alpha != reference alpha
 - 0110 Accept if alpha >= reference alpha
 - 0111 Always accept the pixel
 - 1xxx -reserved-
- 15-8 **Reference Alpha Value**
- 7-4 **Destination Blending Factor**
 - 0000 (0,0,0,0)
 - 0001 (1,1,1,1)
 - 0010 (RS,GS,BS,AS)
 - 0011 (1,1,1,1) - (RS,GS,BS,AS)
 - 0100 (AS,AS,AS,AS)
 - 0101 (1,1,1,1) – (AS,AS,AS,AS)

 - 1000 (RD,GD,BD,AD)
 - 1001 (1,1,1,1) - (RD,GD,BD,AD)
 - 1010 (F,F,F,1); F = min (AS, 1-AD)
 - 1011 -reserved-
 - 11xx -reserved-

Texture Engine Registers

The texture Engine handles texture access and filtering. It is controlled by the Span Engine. It accepts texture coordinates from the Rasterization Engine, generates and passes addresses to the Memory Interface, accepts raw texel data from the Memory Interface, does filtering, and passes the results to the Data Path.

GEbase + A0 – Texture ControlRW

Textures are aligned to 64-bit boundaries on a scanline basis.

- 31 Texture Access Control**
 - 0 Disable (use cache)
 - 1 Enable (bypass cache)
- 30 Filtering Control**
 - 0 Filter with color key. Treat alpha value for keyed texels as 0
 - 1 Downgrade filtering function based on fractional bits of UV and key test result. Set alpha to 0 for keyed texels.
- 29-28 Texture U Boundary Checking Function**
 - 00 Texture U wraparound
 - 01 Texture U mirroring
 - 10 Texture U clamping
 - 11 -reserved-
- 27-26 Texture V Boundary**
 - 00 Texture V wraparound
 - 01 Texture V mirroring
 - 10 Texture V clamping
 - 11 -reserved-
- 25 Texture in System Memory**
 - 0 Texture is stored in graphics memory
 - 1 Texture is stored in system memory
- 24 Reserved (must be 0)**
- 23 MipMap**
 - 0 Disable
 - 1 Enable
- 22 Intra-map Filter**
 - 0 Disable
 - 1 Enable (do filtering inside a LOD level)
- 21 Inter-map Filter**
 - 0 Disable
 - 1 Enable (do filtering inside a LOD level)
M must be 1.
- 20 Magnify Filter (when LOD < 0)**
 - 0 Point Sample
 - 1 Bi-linear

- 19 Tiling**
 - 0 Texture is not tiled
 - 1 Texture is tiled.

Tile size is determined by texel depth:

Texel Depth (bpp)	Tile Size
1	16 x 16
2	8 x 16
4	8 x 8
8	4 x 8
16	4 x 4
32	2 x 4

Inside each tile, texels are organized into 2x2 subtiles in row major
- 18 Texture Color Key**
 - 0 Disable
 - 1 Enable
- 17 Texture Anisotropy**
 - 0 Disable
 - 1 Enable
- 16-15 Palette Data Format**
 - 00 565 RGB
 - 01 1555 ARGB
 - 10 4444 ARGB
 - 11 -reserved-
- 14-12 Texel Depth**
 - 000 1-bpp palettized
 - 001 2-bpp palettized
 - 010 4-bpp palettized
 - 011 8-bpp palettized
 - 100 16-bpp 565 RGB
 - 101 16-bpp 1555 ARGB
 - 110 16-bpp 4444 ARGB
 - 111 32-bpp ARGB
- 11-8 Texture Map Levels (TML) (Range 0-8)**

The number of maps in the MipMap (0 = 1 map)
- 7-4 Y-Axis Texture Memory Size (TRY) (Range 0-8)**

This field determines the number of lsb's (2**TRY) of parameter V to be used in the Y axis. Any bit higher than this will be ignored (wraparound).
- 3-0 X-Axis Texture Memory Size (TRX) (Range 0-8)**

This field determines the number of lsb's (2**TRX) of parameter U to be used in the X axis. Any bit higher than this will be ignored (wraparound).

Note: For MipMap textures, TRX/TRY is the size of the original texture (1:1 map)

GEbase + A4 – Texture Color.....RW

31-24 Alpha

Constant alpha value when there is no alpha in the texture format

23-0 Texture Color Key

Texture transparency color (888 RGB)

GEbase + A8 – Texture Palette Data.....WO

31-16 Texel n+1

15-0 Texel n

An internal counter is used in loading the texture palette. Writing to the Texture register (GEbase+A0) resets the counter to 0. Writing to the Texture Palette Data register writes the data to the place pointed to by the counter then increments the counter by 1. Each write writes two entries into the palette.

GEbase + AC – Texture Boundary.....RW

31-22 Maximum V

21-12 Minimum V

11-8 Reserved always reads 0

7 Reverse Texture Format

10 DXT2 format

11 -reserved-

2-0 Dither Shift

000 Disable LOD dithering

001 100% LOD dithering

010 80% LOD dithering

011 60% LOD dithering

100 40% LOD dithering

101 20% LOD dithering

11x -reserved-

Texture Filtering

Texture data read back from the Memory Interface first goes through palette translation if the texture is palettized. The texture is then converted into common internal 8888 ARGB format. If the texture doesn't have alpha data, then a constant alpha value is used. If the texture color key is enabled and the texture color matches the key, set alpha to 0. Bi-linear or tri-linear filtering is then performed on RGB and alpha. If the color key is enabled and the result alpha is 0, the corresponding pixel should be discarded. This is done by attaching a validity bit with texture data passed from the Texture Engine to the Data Path. It should be noted that filtering depends on the LOD value. When $LOD < 0$, a different filter may be applied. In bi-linear filtering, if the texel nearest to the texture coordinate is masked by the color key, then the texel is considered as masked. Otherwise, the texel is considered not masked.

Memory Interface Registers

The registers in this group include stride and buffer base address registers for frame buffer control. There are three base addresses: source base address (added to blt source), destination base address (added to color destination), and Z base address (added to Z addresses).

GEbase + B8 – Destination Stride / Buffer Base 0.....RW

GEbase + BC – Destination Stride / Buffer Base 1.....RW

GEbase + C0 – Destination Stride / Buffer Base 2RW

GEbase + C4 – Destination Stride / Buffer Base 3RW

GEbase + C8 – Source Stride / Buffer Base 0.....RW

GEbase + CC – Source Stride / Buffer Base 1RW

GEbase + D0 – Source Stride / Buffer Base 2.....RW

GEbase + D4 – Source Stride / Buffer Base 3.....RW

All eight of the above registers have the same bit definitions:

31-29 Bits Per Pixel

- 000 8 bits per pixel
- 001 16 bits per pixel (565 format)
- 010 32 bits per pixel
- 011 -reserved-
- 100 -reserved-
- 101 16 bits per pixel (555 format)
- 11x -reserved-

28-20 Stride (pixels divided by 8)

19-0 Buffer Base Address (in quadwords)

GEbase + D8 – Z Depth / Z Buffer BaseRW

31-30 Z Depth

- 00 16 bits
- 01 24 bits (32 bits are allocated in the frame buffer with the MSB not used)
- 1x -reserved-

29 Reserved always reads 0

28-20 Z Stride

19-0 Z Buffer Base Address (in quadwords)

There are 9 texture base registers for up to 9 levels of MipMaps: level 0 (1:1 map) up to level 8 (smallest). The texture may be in the frame buffer or in system memory.

GEbase+DC – Texture Base MipMap Level 0 (1:1 Map)RW

GEbase + E0 – Texture Base MipMap Level 1 RW

GEbase + E4 – Texture Base MipMap Level 2 RW

GEbase + E8 – Texture Base MipMap Level 3 RW

GEbase + EC – Texture Base MipMap Level 4 RW

GEbase + F0 – Texture Base MipMap Level 5 RW

GEbase + F4 – Texture Base MipMap Level 6 RW

GEbase + F8 – Texture Base MipMap Level 7 RW

GEbase+FC – Texture Base MipMap Level 8 (Smallest)RW

All nine of the above registers have the same bit definitions:

31-0 Texture Base Address (in bytes)

Base addresses always start on QWORD boundaries so bits 2-0 are always 0.

Data Port Area

GEbase + 10000-1FFFFh – Data Port Area RW

FUNCTIONAL DESCRIPTIONS

Graphics Controller Power Management

The PLE133 Graphics Controller power management feature set complies with AGP and PCI power management requirements.

Power Management States

Power management states (D0-D3) for both ACPI and PCI Bus Power Management (PCI PM) refer to the same states described in the Device Class PM Reference Specification for Display Devices, which are equivalent to the VESA™ DPMS power states. System software should access the PLE133's configuration registers to perform PCI PM state transitions.

Power Management Registers

Power management control for the PLE133 Graphics Controller is provided by extended registers SR24 (Power Management Control), GR20 (Standby Timer Control), GR21 (Power Management Control 1), GR22 (Power Management Control 2), GR23 (Power Status), GR24 (Soft Power Control), GR25 (Power Control Select), GR26 (DPMS Control), GR27-28 (GPIO Control), GR2A (Suspend Pin Timer), GR2C (Miscellaneous Pin Control), GR2F (Miscellaneous Internal Control), and Graphics Controller PCI Configuration Indices 90-97 (PCI Power Management Registers 1 and 2).

Table 12. PCI Power Management States

PCI PM State	Desktop Graphics	Notebook Graphics
State 0 (D0)	DPMS State 0 Fully On	Proprietary State 0 Fully On
State 1 (D1)	DPMS State 1 Standby (Hsync Off)	Proprietary State 1 Standby (VCLK Off)
State 2 (D2)	DPMS State 2 Suspend (Vsync Off)	Proprietary State 2 Suspend (MCLK/VCLK Both Off)
State 3 (D3)	DPMS State 3 Off (H/Vsync Both Off)	Same as State 2

Power Management Clock Control

If the system “South Bridge” sends a request to the PLE133 to power down the memory controller, the PLE133 first uses PCKRUN# (the same signal appearing external to the PLE133) to check to see if the internal graphics controller needs to access main memory. The graphics controller logic will detect PCKRUN# high for 2 or 3 PCICLK's and check if there are any:

- Internal buffers not emptied
- PCI Master or AGP Master actions pending

If either condition exists, the graphics controller logic will assert PCKRUN# low for 2 PCICLK's to signal the clock generator to keep PCICLK running.

PME# is not implemented since there are no wake-up conditions.

ELECTRICAL SPECIFICATIONS

Absolute Maximum Ratings

Table 13. Absolute Maximum Ratings

Symbol	Parameter	Min	Max	Unit	Notes
T _C	Case operating temperature	0	85	°C	1
T _S	Storage temperature	-55	125	°C	1
V _{IN}	Input voltage	-0.5	V _{RAIL} + 10%	Volts	1, 2
V _{OUT}	Output voltage	-0.5	V _{RAIL} + 10%	Volts	1, 2

Note 1: Stress above the conditions listed may cause permanent damage to the device. Functional operation of this device should be restricted to the conditions described under operating conditions.

Note 2. V_{RAIL} is defined as the V_{CC} level of the respective rail. The CPU interface can be 3.3V or 2.5V. Memory can be 3.3V only. PCI can be 3.3V or 5.0V. Video can be 3.3V or 5.0V. Flat Panel can be 3.3V only.

DC Characteristics

T_C = 0-85°C, V_{RAIL} = V_{CC} +/- 5%, V_{CORE} = 2.5V +/- 5%, GND=0V

Table 14. DC Characteristics

Symbol	Parameter	Min	Max	Unit	Condition
V _{IL}	Input Low Voltage	-0.50	0.8	V	
V _{IH}	Input High Voltage	2.0	V _{CC} +0.5	V	
V _{OL}	Output Low Voltage	-	0.55	V	I _{OL} =4.0mA
V _{OH}	Output High Voltage	2.4	-	V	I _{OH} =-1.0mA
I _{IL}	Input Leakage Current	-	+/-10	uA	0<V _{IN} <V _{CC}
I _{OZ}	Tristate Leakage Current	-	+/-20	uA	0.55<V _{OUT} <V _{CC}

Power Characteristics

$T_C = 0-85^{\circ}\text{C}$, $V_{\text{RAIL}} = V_{\text{CC}} \pm 5\%$, $V_{\text{CORE}} = 2.5\text{V} \pm 5\%$, $\text{GND}=0\text{V}$

Table 15. DC Characteristics

Symbol	Parameter	Typ	Max	Unit	Condition
I_{CC5}	Power Supply Current – VCC5			mA	Max operating frequency
I_{CC3}	Power Supply Current – VCC3			mA	Max operating frequency
I_{SUS3}	Power Supply Current – VSUS3			mA	Max operating frequency
I_{SUS2}	Power Supply Current – VSUS2			mA	Max operating frequency
I_{CC1}	Power Supply Current – VCCI			mA	Max operating frequency
I_{CCD}	Power Supply Current – VCCD			mA	Max operating frequency
I_{CCR}	Power Supply Current – VCCR			mA	Max operating frequency
I_{TT}	Power Supply Current – VTT			mA	Max operating frequency
I_{REF}	Power Supply Current – GTLREF			mA	Max operating frequency
P_D	Power Dissipation		3.5	W	Max operating frequency

AC Timing Specifications

AC timing specifications provided are based on external zero-pf capacitance load. Min/max cases are based on the following table:

Table 16. AC Timing Min / Max Conditions

Parameter	Min	Max	Unit
5.0V Power	4.75	5.25	Volts
3.3V Power	3.135	3.465	Volts
2.5V Power	2.375	2.625	Volts
Case Operating Temperature	0	85	$^{\circ}\text{C}$

Drive strength for selected output pins is programmable. See Rx6D for details.
