

NDS332P P-Channel Logic Level Enhancement Mode Field Effect Transistor

General Description

These P-Channel logic level enhancement mode power field effect transistors are produced using Fairchild's proprietary, high cell density, DMOS technology. This very high density process is especially tailored to minimize on-state resistance. These devices are particularly suited for low voltage applications such as notebook computer power management, portable electronics, and other battery powered circuits where fast high-side switching, and low in-line power loss are needed in a very small outline surface mount package.

Features

- -1 A, -20 V, $R_{DS(ON)} = 0.41 \Omega @ V_{GS} = -2.7 V$
 $R_{DS(ON)} = 0.3 \Omega @ V_{GS} = -4.5 V$.
- Very low level gate drive requirements allowing direct operation in 3V circuits. $V_{GS(th)} < 1.0V$.
- Proprietary package design using copper lead frame for superior thermal and electrical capabilities.
- High density cell design for extremely low $R_{DS(ON)}$.
- Exceptional on-resistance and maximum DC current capability.
- Compact industry standard SOT-23 surface Mount package.

Absolute Maximum Ratings $T_A = 25^\circ C$ unless otherwise noted

Notes:

- $R_{\theta_{JA}}$ is the sum of the junction-to-case and case-to-ambient thermal resistance where the case thermal reference is defined as the solder mounting surface of the drain pins. $R_{\theta_{JC}}$ is guaranteed by design while $R_{\theta_{CA}}$ is determined by the user's board design.

$$P_D(t) = \frac{T_J - T_A}{R_{\theta_{JA}}(t)} = \frac{T_J - T_A}{R_{\theta_{JC}} + R_{\theta_{CA}}(t)} = I_D^2(t) \times R_{DS(ON)} @ T_J$$

Typical $R_{\theta_{JA}}$ using the board layouts shown below on 4.5"x5" FR-4 PCB in a still air environment:

- 250°C/W when mounted on a 0.02 in² pad of 2oz copper.
- 270°C/W when mounted on a 0.001 in² pad of 2oz copper.
