

Features

- Double superhet architecture for high degree of image rejection
- □ FSK for digital data and FM reception for analog signal transmission
- □ FM/FSK demodulation with phase-coincidence demodulator
- Low current consumption in active mode and very low standby current
- Switchable LNA gain for improved dynamic range
- RSSI allows signal strength indication and ASK detection
- □ Surface mount package LQFP32

Technical Data Overview

- □ Input frequency range: 300 MHz to 450 MHz
- Power supply range: 2.5 V to 5.5 V
- □ Temperature range: -40 °C to +85 °C
- Operating current: 6.5 mA at low gain and 8.2 mA at high gain mode
- □ Standby current: < 100 nA
- Sensitivity: -111 dBm¹⁾ with 40 kHz second IF filter BW (incl. SAW front-end filter loss)
 Sensitivity: -104 dBm²⁾ with 150 kHz second IF filter BW (incl. SAW front-end filter loss)
- Range of first IF: 10 MHz to 80 MHz
- Range of second IF: 455 kHz to 21.4 MHz
- □ Maximum input level: -10 dBm at ASK and 0 dBm at FSK
- □ Image rejection: > 65 dB (e.g. with SAW front-end filter and at 10.7 MHz 2nd IF)
- □ Spurious emission: < -70 dBm
- □ Input frequency acceptance: ±50 kHz (with AFC option)
- □ RSSI range: 70 dB
- □ Frequency deviation range: ±5 kHz to ±120 kHz
- Maximum data rate: 80 kbit/s NRZ
- Maximum analog modulation frequency: 15 kHz
 - ¹⁾ at ± 8 kHz FSK deviation, BER = $3 \cdot 10^{-3}$ and phase-coincidence demodulation ²⁾ at ± 50 kHz FSK deviation, BER = $3 \cdot 10^{-3}$ and phase-coincidence demodulation

General Description

The TH71102 receiver IC consists of the following building blocks:

- PLL synthesizer (PLL SYNTH) for generation of the first and second local oscillator signals LO1 and LO2
- Parts of the PLL SYNTH are the high-frequency VCO1, the feedback dividers DIV_8 and DIV_2,
- a phase-frequency detector (PFD) with charge pump (CP) and a crystal-based reference oscillator (RO)
 Low-noise amplifier (LNA) for high-sensitivity RF signal reception
- First mixer (MIX1) for down-conversion of the RF signal to the first IF (IF1)
- second mixer (MIX2) for down-conversion of the IF1 to the second IF (IF2)
- IF amplifier (IFA) to amplify and limit the IF2 signal and for RSSI generation
- Phase coincidence demodulator (DEMOD) with third mixer (MIX3) to demodulate the IF signal
- Operational amplifier (OA) for data slicing, filtering and ASK detection
- Bias circuitry for bandgap biasing and circuit shutdown

With the TH71102 receiver chip, various circuit configurations can be arranged in order to meet a number of different customer requirements. For FM/FSK reception the IF tank used in the phase coincidence demodulator can be constituted either by a ceramic resonator or an LC tank (optionally with a varactor diode to create an AFC circuit). In ASK configuration, the RSSI signal is feed to an ASK detector, which is constituted by the operational amplifier.

| Demodulation | Type of receiver | | | |
|--|--|--|--|--|
| FM / FSK narrow-band RX with ceramic demodulation tank | | | | |
| FM / FSK | wide-band RX with LC demodulation tank | | | |
| ASK | RX with RSSI-based demodulation | | | |

The superheterodyne configuration is double conversion where MIX1 and MIX2 are driven by the internal local oscillator signals LO1 and LO2, respectively. This allows a high degree of image rejection, achieved in conjunction with an RF frontend filter. Efficient RF frontend filtering is realized by using a SAW, ceramic or helix filter in front of the LNA and by adding an LC filter at the LNA output.

A single-conversion variant, called TH71101, is also available. Both RXICs have the same die. At the TH71101 the second mixer MIX2 operates as an amplifier.

Frequency Planning

Frequency planning is straightforward for single-conversion applications because there is only one IF that might be chosen, and then the only possible choice is low-side or high-side injection of the LO1 signal (which is now the one and only LO signal in the receiver).

The receiver's double-conversion architecture requires careful frequency planning. Besides the desired RF input signal, there are a number of spurious signals that may cause an undesired response at the output. Among them are the image of the RF signal (that must be suppressed by the RF front-end filter), spurious signals injected to the first IF (IF1) and their images which could be mixed down to the same second IF (IF2) as the desired RF signal (they must be suppressed by the LC filter at IF1 and/or by low-crosstalk design).

By configuring the TH71102 for double conversion and using its internal PLL synthesizer with fixed feedback divider ratios of N1 = 8 (DIV_8) and N2 = 2 (DIV_2), four types of down-conversion are possible: low-side injection of LO1 and LO2 (**low-low**), LO1 low-side and LO2 high-side (**low-high**), LO1 high-side and LO2 low-side (**high-low**) or LO1 and LO2 high-side (**high-high**). The following table summarizes some equations that are useful to calculate the crystal reference frequency (REF), the first IF (IF1) and the VCO1 or first LO frequency (LO1), respectively, for a given RF and second IF (IF2).

| Injection type | high-high | low-low | high-low | low-high |
|----------------|---------------|---------------|---------------|---------------|
| REF | (RF – IF2)/14 | (RF – IF2)/18 | (RF + IF2)/14 | (RF + IF2)/18 |
| LO1 | 16•REF | 16•REF | 16•REF | 16•REF |
| IF1 | LO1 – RF | RF – LO1 | LO1 – RF | RF – LO1 |
| LO2 | 2•REF | 2•REF | 2•REF | 2•REF |
| IF2 | LO2 – IF1 | IF1 – LO2 | IF1 – LO2 | LO2 – IF1 |

The following table depicts generated, desired, possible images and some undesired signals considering the examples of 315 MHz and 433.6 MHz RF reception at IF2 = 10.7 MHz.

The selection of the reference crystal frequency is based on some assumptions. As for example: the first IF and the image frequencies should not be in a radio band where strong interfering signals might occur (because they could represent parasitic receiving signals), the LO1 signal should be in the range of 300 MHz to 430 MHz (because this is the optimum frequency range of the VCO1). Furthermore the first IF should be as high as possible to achieve highest RF image rejection. The columns in bold depict the selected frequency plans to receive at 315 MHz and 433.6 MHz, respectively.
