

# COP87LxxCJ/RJ Family 8-Bit CMOS OTP Microcontrollers with 4k or 32k Memory and Comparator

## General Description

The COP87LxxCJ/RJ Family OTP (One Time Programmable) microcontrollers are integrated COP8™ Base core devices with 4k or 32k memory, and an Analog comparator (no brownout). These multi-chip CMOS devices are suited for lower-functionality applications, and as pre-production devices for a ROM design. Low cost, pin and software compatible (plus Brownout) 1k or 2k ROM versions are available (COP820CJ/840CJ Family). Versions are available for use with a range of COP8 software and hardware development tools.

Family features include an 8-bit memory mapped architecture, 10 MHz CKI with 1µs instruction cycle, three clock op-

tions (-1 = crystal; -2 = external; -3 = internal RC), one multi-function 16-bit timer/counter, MICROWIRE/PLUS™ serial I/O, one analog comparator, power saving HALT mode with multi-sourced wakeup/interrupt capability, on-chip R/C oscillator capacitor, high current outputs, software selectable I/O options, WATCHDOG™ timer, modulator/timer, Power on Reset, program code security, 2.7V to 5.5V operation and 20/28 pin packages.

In this datasheet, the term COP87L20CJ refers to the COP87L20CJ, and COP87L22CJ. COP840CJ refers to the COP87L40CJ, COP87L42CJ, COP87L40RJ, and COP87L42RJ.

Devices included in this datasheet are:

| Device     | Memory (bytes) | RAM (bytes) | I/O Pins | Packages    | Temperature  |
|------------|----------------|-------------|----------|-------------|--------------|
| COP87L20CJ | 4k OTP EPROM   | 64          | 24       | 28 DIP/SOIC | -40 to +85°C |
| COP87L22CJ | 4k OTP EPROM   | 64          | 16       | 20 DIP/SOIC | -40 to +85°C |
| COP87L40CJ | 4k OTP EPROM   | 128         | 24       | 28 DIP/SOIC | -40 to +85°C |
| COP87L42CJ | 4k OTP EPROM   | 128         | 16       | 20 DIP/SOIC | -40 to +85°C |
| COP87L40RJ | 32k OTP EPROM  | 128         | 24       | 28 DIP/SOIC | -40 to +85°C |
| COP87L42RJ | 32k OTP EPROM  | 128         | 16       | 20 DIP/SOIC | -40 to +85°C |

## Key Features

- Multi-Input Wakeup (on the 8-bit Port L)
- Analog comparator
- Modulator/Timer (high speed PWM timer for IR transmission)
- 16-bit multi-function timer supporting
  - PWM mode
  - External event counter mode
  - Input capture mode
- Integrated capacitor for the R/C oscillator
- 4 or 32 kbyte on-board OTP EPROM with security feature
- 64 or 128 bytes on-chip RAM

## I/O Features

- Software selectable I/O options (TRI-STATE®, Push-Pull, Weak Pull-Up Input, High Impedance Input)
- High current outputs (8 pins)
- Schmitt trigger inputs on Port G
- MICROWIRE/PLUS serial I/O
- Packages:
  - 20 DIP/SO with 16 I/O pins
  - 28 DIP/SO with 24 I/O pins

## CPU/Instruction Set Features

- 1 µs instruction cycle time
- Three multi-source interrupts servicing
  - External interrupt with selectable edge
  - Timer interrupt
  - Software interrupt
- Versatile and easy to use instruction set
- 8-bit stack pointer (SP)—stack in RAM
- Two 8-bit Register Indirect Data Memory Pointers (B and X)

## Fully Static CMOS

- Low current drain (typically <1 µA)
- Single supply operation: 2.7V to 5.5V
- Temperature range: -40°C to +85°C

## Development Support

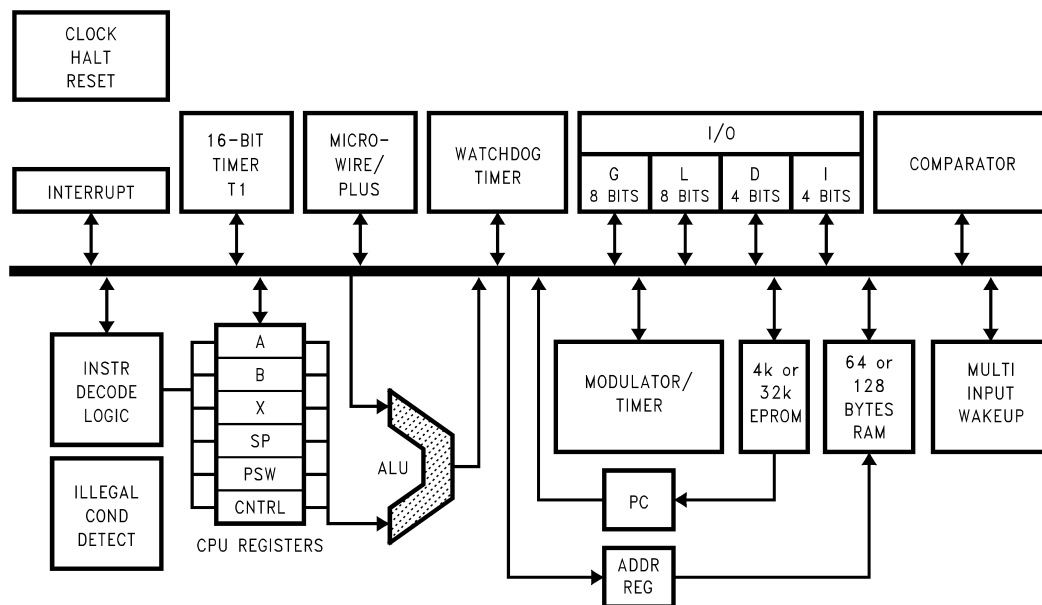

- Emulation device for the COP820CJ/COP840CJ
- Real time emulation and full program debug offered by MetaLink Development Systems

## Pin Assignment

| Port Pin        | Typ | ALT Funct.  | 20 Pin | 28 Pin |
|-----------------|-----|-------------|--------|--------|
| L0              | I/O | MIWU/CMPOUT | 7      | 11     |
| L1              | I/O | MIWU/MPIN-  | 8      | 12     |
| L2              | I/O | MIWU/MPIN+  | 9      | 13     |
| L3              | I/O | MIWU        | 10     | 14     |
| L4              | I/O | MIWU        | 11     | 15     |
| L5              | I/O | MIWU        | 12     | 16     |
| L6              | I/O | MIWU        | 13     | 17     |
| L7              | I/O | MIWU/MODOUT | 14     | 18     |
| G0              | I/O | INTR        | 17     | 25     |
| G1              | I/O |             | 18     | 26     |
| G2              | I/O |             | 19     | 27     |
| G3              | I/O | TIO         | 20     | 28     |
| G4              | I/O | SO          | 1      | 1      |
| G5              | I/O | SK          | 2      | 2      |
| G6              | I   | SI          | 3      | 3      |
| G7              | I   | CKO         | 4      | 4      |
| I0              | I   |             |        | 7      |
| I1              | I   |             |        | 8      |
| I2              | I   |             |        | 9      |
| I3              | I   |             |        | 10     |
| D0              | O   |             |        | 19     |
| D1              | O   |             |        | 20     |
| D2              | O   |             |        | 21     |
| D3              | O   |             |        | 22     |
| V <sub>CC</sub> |     |             | 6      | 6      |
| GND             |     |             | 15     | 23     |
| CKI             |     |             | 5      | 5      |
| RESET           |     |             | 16     | 24     |

**Absolute Maximum Ratings** (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage ( $V_{CC}$ ) 7.0V  
Voltage at any Pin  $-0.3V$  to  $V_{CC} + 0.3V$

Total Current into  $V_{CC}$  pin (Source) 80 mA

Total Current out of GND pin (sink) 80 mA

Storage Temperature Range  $-65^{\circ}\text{C}$  to  $+150^{\circ}\text{C}$

**Note 1:** Absolute maximum ratings indicate limits beyond which damage to the device may occur. DC and AC electrical specifications are not ensured when operating the device at absolute maximum ratings.

**DC Electrical Characteristics**

$-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$  unless otherwise specified

| Parameter                                      | Conditions                          | Min          | Typ | Max           | Units   |

| All Others                                     |                                     |              |     |               |         |
| Source (Weak Pull-up Mode)                     | $V_{CC} = 4.5V$ , $V_{OH} = 3.2V$   | -10          |     | -110          | $\mu A$ |
| Source (Push-pull Mode)                        | $V_{CC} = 4.5V$ , $V_{OH} = 3.8V$   | -0.4         |     |               | mA      |
| Sink (Push-pull Mode)                          | $V_{CC} = 4.5V$ , $V_{OL} = 0.4V$   | 1.6          |     |               | mA      |
| (COP887L20CJ)                                  | $V_{CC} = 5.5V$ , $V_{OL} = 0.4V$   |              |     |               |         |
| TRI-STATE Leakage                              |                                     | -2.0         |     | +2.0          | $\mu A$ |
| Allowable Sink/Source Current Per Pin          |                                     |              |     |               |         |
| D Outputs                                      |                                     |              |     | 15            | mA      |
| L4-L7 (Sink)                                   |                                     |              |     | 20            | mA      |
| All Others                                     |                                     |              |     | 3             | mA      |
| Maximum Input Current without Latchup (Note 6) | Room Temperature                    |              |     | $\pm 100$     | mA      |
| RAM Retention Voltage, $V_r$                   | 500 ns Rise and Fall Time (Min)     | 2.0          |     |               | V       |
| Input Capacitance                              |                                     |              |     | 7             | pF      |
| Load Capacitance on D2                         |                                     |              |     | 1000          | pF      |

**Note 2:** Rate of voltage change must be less than 10 V/mS.

**Note 3:** Supply current is measured after running 2000 cycles with a square wave CKI input, CKO open, inputs at rails and outputs open.

## DC Electrical Characteristics (Continued)

**Note 4:** The HALT mode will stop CKI from oscillating in the RC and crystal configurations by bringing CKI high. HALT test conditions: L, and G0..G5 ports configured as outputs and set high. The D port set to zero. All inputs tied to  $V_{CC}$ . The comparator is disabled.

**Note 5:** The user must guarantee that D2 pin does not source more than 10 mA during RESET. If D2 sources more than 10 mA during reset, the device will go into programming mode.

**Note 6:** Pins G6 and  $\overline{\text{RESET}}$  are designed with a high voltage input network. These pins allow input voltages greater than  $V_{CC}$  and the pins will have sink current to  $V_{CC}$  when biased at voltages greater than  $V_{CC}$  (the pins do not have source current when biased at a voltage below  $V_{CC}$ ). The effective resistance to  $V_{CC}$  is 750 $\Omega$  (typical). These two pins will not latch up. The voltage at the pins must be limited to less than 14V.

## AC Electrical Characteristics

$-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$  unless otherwise specified

| Parameter   | Conditions                                 | Min | Typ | Max | Units         |
|---|--|-----|-----|-----|---------------|
| Instruction Cycle Time ( $t_c$ )                          |  |     |     |     |               |
| Crystal/Resonator   | $4.5\text{V} \leq V_{CC} \leq 5.5\text{V}$ | 1   |     | DC  | $\mu\text{s}$ |

FIGURE 3. MICROWIRE/PLUS Timing

## Pin Description

$V_{CC}$  and **GND** are the power supply pins.

**CKI** is the clock input. This can come from an external source, a R/C generated oscillator or a crystal (in conjunction with CKO). See Oscillator description.

**RESET** is the master reset input. See Reset description.

**PORT I** is a 4-bit Hi-Z input port.

**PORT L** is an 8-bit I/O port.

There are two registers associated with the L port: a data register and a configuration register. Therefore, each L I/O bit can be individually configured under software control as shown below:

| Port L Config. | Port L Data | Port L Setup            |
|----------------|-------------|-------------------------|
| 0              | 0           | Hi-Z Input (TRI-STATE)  |
| 0              | 1           | Input with Weak Pull-up |
| 1              | 0           | Push-pull Zero Output   |
| 1              | 1           | Push-pull One Output    |

Three data memory address locations are allocated for this port, one each for data register [00D0], configuration register [00D1] and the input pins [00D2].

Port L has the following alternate features:

- L7 MIWU or MODOUT (high sink current capability)
- L6 MIWU (high sink current capability)
- L5 MIWU (high sink current capability)
- L4 MIWU (high sink current capability)
- L3 MIWU
- L2 MIWU or CMPIN+
- L1 MIWU or CMPIN-
- L0 MIWU or CMPOUT

The selection of alternate Port L functions is done through registers WKEN [00C9] to enable MIWU and CNTRL2 [00CC] to enable comparator and modulator.

All eight L-pins have Schmitt Triggers on their inputs.

**PORT G** is an 8-bit port with 6 I/O pins (G0–G5) and 2 input pins (G6, G7).

All eight G-pins have Schmitt Triggers on the inputs.

There are two registers associated with the G port: a data register and a configuration register. Therefore each G port bit can be individually configured under software control as shown below:

| Port G Config. | Port G Data | Port G Setup            |
|----------------|-------------|-------------------------|
| 0              | 0           | Hi-Z Input (TRI-STATE)  |
| 0              | 1           | Input with Weak Pull-up |
| 1              | 0           | Push-pull Zero Output   |
| 1              | 1           | Push-pull One Output    |

Three data memory address locations are allocated for this port, one for data register [00D4], one for configuration register [00D5] and one for the input pins [00D6]. Since G6 and G7 are Hi-Z input only pins, any attempt by the user to configure them as outputs by writing a one to the configuration register will be disregarded. Reading the G6 and G7 configuration bits will return zeros. Note that the device will be placed in the Halt mode by writing a “1” to the G7 data bit.

Six pins of Port G have alternate features:

- G7 CKO crystal oscillator output (selected by mask option) or HALT restart input/general purpose input (if clock option is R/C or external clock)
- G6 SI (MICROWIRE serial data input)
- G5 SK (MICROWIRE clock I/O)
- G4 SO (MICROWIRE serial data output)
- G3 TIO (timer/counter input/output)
- G0 INTR (an external interrupt)

Pins G2 and G1 currently do not have any alternate functions.

The selection of alternate Port G functions are done through registers PSW [00EF] to enable external interrupt and CNTRL1 [00EE] to select TIO and MICROWIRE operations.

**PORT D** is a four bit output port that is preset when RESET goes low. One data memory address location is allocated for the data register [00DC]. The user can tie two or more D port outputs (except D2 pin) together in order to get a higher drive.

**Note:** Care must be exercised with the D2 pin operation. At RESET, the external loads on this pin must ensure that the output voltages stay above  $0.8 V_{CC}$  to prevent the chip from entering special modes. Also keep the external loading on D2 to less than 1000 pF.

## Functional Description

The internal architecture is shown in the block diagram. Data paths are illustrated in simplified form to depict how the various logic elements communicate with each other in implementing the instruction set of the device.

### ALU and CPU Registers

The ALU can do an 8-bit addition, subtraction, logical or shift operations in one cycle time. There are five CPU registers:

- A is the 8-bit Accumulator register
- PC is the 15-bit Program Counter register
  - PU is the upper 7 bits of the program counter (PC)
  - PL is the lower 8 bits of the program counter (PC)
- B is the 8-bit address register and can be auto incremented or decremented.
- X is the 8-bit alternate address register and can be auto incremented or decremented.
- SP is the 8-bit stack pointer which points to the subroutine stack (in RAM).

B, X and SP registers are mapped into the on chip RAM. The B and X registers are used to address the on chip RAM. The SP register is used to address the stack in RAM during subroutine calls and returns. The SP must be initialized by software before any subroutine call or interrupts occurs.

## Memory

The memory is separated into two memory spaces: program and data.

### PROGRAM MEMORY

Program memory consists of 4 kbytes of OTP EPROM. These bytes of ROM may be instructions or constant data. The memory is addressed by the 15-bit program counter (PC). ROM can be indirectly read by the LAID instruction for table lookup.

The device can be configured to inhibit external reads of the program memory. This is done by programming the Security Byte.

## Memory (Continued)

### SECURITY FEATURE

The memory array has an associate Security Byte that is located outside of the program address range. This byte can be addressed only from programming mode by a programmer tool.

Security is an optional feature and can only be asserted after the memory array has been programmed and verified. A secured part will read all 00(hex) by a programmer. The part will fail Blank Check and will fail Verify operations. A Read operation will fill the programmer's memory with 00(hex). The Security Byte itself is always readable with value of 00(hex) if unsecure and FF(hex) if secure.

### DATA MEMORY

The data memory address space includes on chip RAM, I/O and registers. Data memory is addressed directly by the instruction or indirectly through B, X and SP registers. The device has 128 bytes of RAM. Sixteen bytes of RAM are mapped as "registers", these can be loaded immediately, decremented and tested. Three specific registers: X, B, and SP are mapped into this space, the other registers are available for general usage.

Any bit of data memory can be directly set, reset or tested. All I/O and registers (except A and PC) are memory mapped; therefore, I/O bits and register bits can be directly and individually set, reset and tested, except the write once only bit (WDREN, WATCHDOG Reset Enable), and the unused and read only bits in CNTRL2 and WDREG registers.

**Note:** RAM contents are undefined upon power-up.

## Reset

### EXTERNAL RESET

The RESET input pin when pulled low initializes the micro-controller. The user must insure that the RESET pin is held low until  $V_{CC}$  is within the specified voltage range and the clock is stabilized. An R/C circuit with a delay 5x greater than the power supply rise time is recommended (Figure 4). The device immediately goes into reset state when the RESET input goes low. When the RESET pin goes high the device comes out of reset state synchronously. The device will be running within two instruction cycles of the RESET pin going high. The following actions occur upon reset:

|  |  |
|--|--|
| Port L                                       | TRI-STATE  |
| Port G                                       | TRI-STATE  |
| Port D                                       | HIGH   |
| PC   | CLEARED  |
| RAM Contents                                 | RANDOM with Power-On-Reset<br>UNAFFECTED with external Reset (power already applied) |
| B, X, SP                                     | Same as RAM  |
| PSW, CNTRL1, CNTRL2 and WDREG Reg.           | CLEARED  |
| Multi-Input Wakeup Reg. WKEDG, WKEN<br>WKPND | CLEARED<br>UNKNOWN   |

|  |                                       |
|--|---------------------------------------|
| Data and Configuration Registers for L & G | CLEARED                               |
| WATCHDOG Timer                             | Prescaler/Counter each loaded with FF |

The device comes out of the HALT mode when the RESET pin is pulled low. In this case, the user has to ensure that the RESET signal is low long enough to allow the oscillator to restart. An internal  $256 t_c$  delay is normally used in conjunction with the two pin crystal oscillator. When the device comes out of the HALT mode through Multi-Input Wakeup, this delay allows the oscillator to stabilize.

The following additional actions occur after the device comes out of the HALT mode through the RESET pin.

If a two pin crystal/resonator oscillator is being used:

|                                  |           |
|----------------------------------|-----------|
| RAM Contents                     | UNCHANGED |
| Timer T1 and A Contents          | UNKNOWN   |
| WATCHDOG Timer Prescaler/Counter | ALTERED   |

If the external or RC Clock option is being used:

|                                  |           |
|----------------------------------|-----------|
| RAM Contents                     | UNCHANGED |
| Timer T1 and A Contents          | UNCHANGED |
| WATCHDOG Timer Prescaler/Counter | ALTERED   |

$RC > 5 \times \text{Power Supply Rise Time}$

**FIGURE 4. Recommended Reset Circuit**

### WATCHDOG RESET

With WATCHDOG enabled, the WATCHDOG logic resets the device if the user program does not service the WATCHDOG timer within the selected service window. The WATCHDOG reset does not disable the WATCHDOG. Upon WATCHDOG reset, the WATCHDOG Prescaler/Counter are each initialized with FF Hex.

The following actions occur upon WATCHDOG reset that are different from external reset.

WDREN WATCHDOG Reset Enable bit UNCHANGED

WDUDF WATCHDOG Underflow bit UNCHANGED

Additional initialization actions that occur as a result of WATCHDOG reset are as follows:

|   |           |
|---|-----------|
| Port L  | TRI-STATE |
| Port G  | TRI-STATE |
| Port D  | HIGH      |
| PC  | CLEARED   |
| Ram Contents  | UNCHANGED |
| B, X, SP  | UNCHANGED |
| PSW, CNTRL1 and CNTRL2 (except WDUDF Bit) Registers | CLEARED   |

## Reset (Continued)

|  |  |
|--|--|

## Oscillator Circuits

### EXTERNAL OSCILLATOR

By selecting the external oscillator option, the CKI pin can be driven by an external clock signal provided it meets the specified duty cycle, rise and fall times, and input levels. The G7/CKO is available as a general purpose input G7 and/or HALT control.

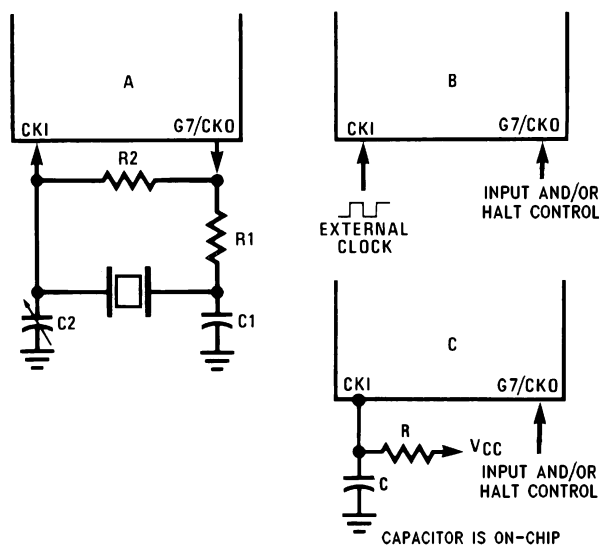

### CRYSTAL OSCILLATOR

By selecting the crystal oscillator option, the G7/CKO pin is connected as a clock output, CKI and G7/CKO can be connected to make a crystal controlled oscillator. *Table 1* shows the clock frequency for different component values. See *Figure 5* for the connections.

### R/C OSCILLATOR

By selecting R/C oscillator option, connecting a resistor from the CKI pin to  $V_{CC}$  makes a R/C oscillator. The capacitor is on-chip. The G7/CKO pin is available as a general purpose input G7 and/or HALT control. Adding an external capacitor will jeopardize the clock frequency tolerance and increase EMI emissions.

*Table 2* shows the clock frequency for the different resistor values. The capacitor is on-chip. See *Figure 5* for the connections.

## Halt Mode

The device is a fully static device. The device enters the HALT mode by writing a one to the G7 bit of the G data register. Once in the HALT mode, the internal circuitry does not receive any clock signal and is therefore frozen in the exact state it was in when halted. In this mode the chip will only draw leakage current.

The device supports three different methods of exiting the HALT mode. The first method is with a low to high transition on the CKO (G7) pin. This method precludes the use of the crystal clock configuration (since CKO is a dedicated output). It may be used either with an RC clock configuration or an external clock configuration. The second method of exiting the HALT mode is with the multi-Input Wakeup feature on the L port. The third method of exiting the HALT mode is by pulling the RESET input low.

If the two pin crystal/resonator oscillator is being used and Multi-Input Wakeup causes the device to exit the HALT mode, the WAKEUP signal does not allow the chip to start running immediately since crystal oscillators have a delayed start up time to reach full amplitude and frequency stability. The WATCHDOG timer (consisting of an 8-bit prescaler followed by an 8-bit counter) is used to generate a fixed delay of  $256t_c$  to ensure that the oscillator has indeed stabilized before allowing instruction execution. In this case, upon detecting a valid WAKEUP signal only the oscillator circuitry is enabled. The WATCHDOG Counter and Prescaler are each loaded with a value of FF Hex. The WATCHDOG prescaler is clocked with the  $t_c$  instruction cycle. (The  $t_c$  clock is derived by dividing the oscillator clock down by a factor of 10).

The Schmitt trigger following the CKI inverter on the chip ensures that the WATCHDOG timer is clocked only when the oscillator has a sufficiently large amplitude to meet the Schmitt trigger specs. This Schmitt trigger is not part of the oscillator closed loop. The start-up timeout from the WATCHDOG timer enables the clock signals to be routed to the rest of the chip. The delay is not activated when the device comes out of HALT mode through RESET pin. Also, if the clock option is either RC or External clock, the delay is not used, but the WATCHDOG Prescaler/Counter contents are changed. The Development System will not emulate the  $256t_c$  delay.

The RESET pin will cause the device to reset and start executing from address X'0000. A low to high transition on the G7 pin (if single pin oscillator is used) or Multi-Input Wakeup will cause the device to start executing from the address following the HALT instruction.

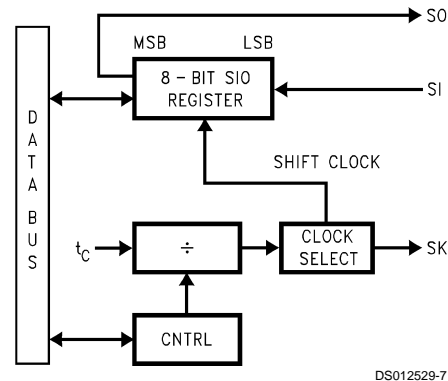

When RESET pin is used to exit the device from the HALT mode and the two pin crystal/resonator (CKI/CKO) clock option is selected, the contents of the Accumulator and the Timer T1 are undetermined following the reset. All other information except the WATCHDOG Prescaler/Counter contents is retained until continuing. All information except the WATCHDOG Prescaler/Counter contents is retained if the device exits the HALT mode through G7 pin or Multi-Input Wakeup.

G7 is the HALT-restart pin, but it can still be used as an input. If the device is not halted, G7 can be used as a general purpose input.

**Note:** To allow clock resynchronization, it is necessary to program two NOP's immediately after the device comes out of the HALT mode. The user must program two NOP's following the "enter HALT mode" (set G7 data bit) instruction.

## MICROWIRE/PLUS

MICROWIRE/PLUS is a serial synchronous bidirectional communications interface. The MICROWIRE/PLUS capability enables the device to interface with any of National Semiconductor's MICROWIRE peripherals (i.e. A/D converters, display drivers, EEPROMS, etc.) and with other microcontrollers which support the MICROWIRE/PLUS interface. It consists of an 8-bit serial shift register (SIO) with serial data input (SI), serial data output (SO) and serial shift clock (SK). Figure 6 shows the block diagram of the MICROWIRE/PLUS interface.

DS012529-7

FIGURE 6. MICROWIRE/PLUS Block Diagram

The shift clock can be selected from either an internal source or an external source. Operating the MICROWIRE/PLUS interface with the internal clock source is called the Master mode of operation. Operating the MICROWIRE/PLUS interface with an external shift clock is called the Slave mode of operation.

The CNTRL register is used to configure and control the MICROWIRE/PLUS mode. To use the MICROWIRE/PLUS, the MSEL bit in the CNTRL register is set to one. The SK clock rate is selected by the two bits, SL0 and SL1, in the CNTRL register. Table 3 details the different clock rates that may be selected.

TABLE 3.

| SL1 | SL0 | SK Cycle Time |
|-----|-----|---------------|
| 0   | 0   | $2t_c$        |
| 0   | 1   | $4t_c$        |
| 1   | x   | $8t_c$        |

where,

$t_c$  is the instruction cycle time.

### MICROWIRE/PLUS OPERATION

Setting the BUSY bit in the PSW register causes the MICROWIRE/PLUS arrangement to start shifting the data. It gets reset when eight data bits have been shifted. The user may reset the BUSY bit by software to allow less than 8 bits to shift. The device may enter the MICROWIRE/PLUS mode either as a Master or as a Slave. Figure 7 shows how two device microcontrollers and several peripherals may be interconnected using the MICROWIRE/PLUS arrangement.

### Master MICROWIRE/PLUS Operation

In the MICROWIRE/PLUS Master mode of operation the shift clock (SK) is generated internally by the device. The MICROWIRE/PLUS Master always initiates all data ex-

## MICROWIRE/PLUS (Continued)

changes (Figure 7). The MSEL bit in the CNTRL register must be set to enable the SO and SK functions on the G Port. The SO and SK pins must also be selected as outputs by setting appropriate bits in the Port G configuration register. Table 4 summarizes the bit settings required for Master mode of operation.

### Slave MICROWIRE/PLUS Operation

In the MICROWIRE/PLUS Slave mode of operation the SK clock is generated by an external source. Setting the MSEL bit in the CNTRL register enables the SO and SK functions on the G Port. The SK pin must be selected as an input and the SO pin selected as an output pin by appropriately setting up the Port G configuration register. Table 4 summarizes the settings required to enter the Slave mode of operation.

The user must set the BUSY flag immediately upon entering the Slave mode. This will ensure that all data bits sent by the Master will be shifted properly. After eight clock pulses the BUSY flag will be cleared and the sequence may be repeated (see Figure 7).

TABLE 4.

| G4 Config. Bit | G5 Config. Bit | G4 Fun.   | G5 Fun. | G6 Fun. | Operation        |
|----------------|----------------|-----------|---------|---------|------------------|
| 1              | 1              | SO        | Int. SK | SI      | MICROWIRE Master |
| 0              | 1              | TRI-STATE | Int. SK | SI      | MICROWIRE Master |

| 0              | 0              | TRI-STATE | Ext. SK | SI      | MICROWIRE Slave  |

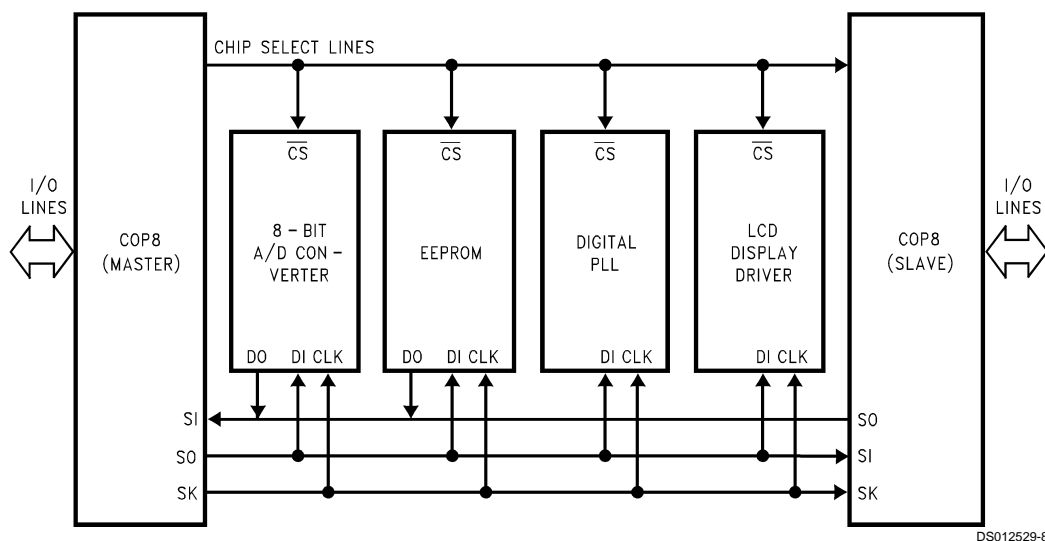

FIGURE 7. MICROWIRE/PLUS Application

DS012529-8

## Timer/Counter

The device has a powerful 16-bit timer with an associated 16-bit register enabling it to perform extensive timer functions. The timer T1 and its register R1 are each organized as two 8-bit read/write registers. Control bits in the register

CNTRL allow the timer to be started and stopped under software control. The timer-register pair can be operated in one of three possible modes. *Table 5* details various timer operating modes and their requisite control settings.

TABLE 5. Timer Operating Modes

| CNTRL Bits<br>7 6 5 | Operation Mode                        | T Interrupt     | Timer Counter On |
|---------------------|---------------------------------------|-----------------|------------------|
| 0 0 0               | External Counter w/Auto-Load Reg.     | Timer Underflow | TIO Pos. Edge    |

### MODE 1. TIMER WITH AUTO-LOAD REGISTER

In this mode of operation, the timer T1 counts down at the instruction cycle rate. Upon underflow the value in the register R1 gets automatically reloaded into the timer which continues to count down. The timer underflow can be programmed to interrupt the microcontroller. A bit in the control register CNTRL enables the TIO (G3) pin to toggle upon timer underflows. This allows the generation of square-wave outputs or pulse width modulated outputs under software control (*Figure 8*).

### MODE 2. EXTERNAL COUNTER

In this mode, the timer T1 becomes a 16-bit external event counter. The counter counts down upon an edge on the TIO pin. Control bits in the register CNTRL program the counter to decrement either on a positive edge or on a negative edge. Upon underflow the contents of the register R1 are automatically copied into the counter. The underflow can also be programmed to generate an interrupt (*Figure 8*).

FIGURE 8. Timer/Counter Auto Reload Mode Block Diagram

### MODE 3. TIMER WITH CAPTURE REGISTER

Timer T1 can be used to precisely measure external frequencies or events in this mode of operation. The timer T1 counts down at the instruction cycle rate. Upon the occurrence of a specified edge on the TIO pin the contents of the timer T1 are copied into the register R1. Bits in the control register CNTRL allow the trigger edge to be specified either

as a positive edge or as a negative edge. In this mode the user can elect to be interrupted on the specified trigger edge (*Figure 9*).

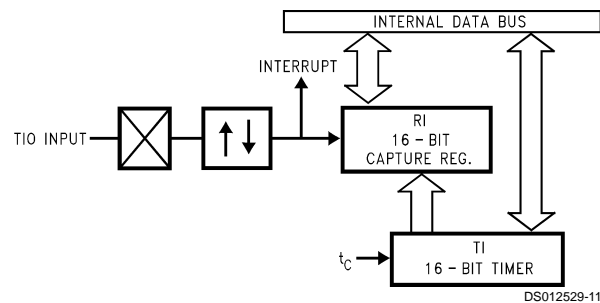

FIGURE 9. Timer Capture Mode Block Diagram

### TIMER PWM APPLICATION

*Figure 10* shows how a minimal component D/A converter can be built out of the Timer-Register pair in the Auto-Reload mode. The timer is placed in the "Timer with auto reload" mode and the TIO pin is selected as the timer output. At the outset the TIO pin is set high, the timer T1 holds the on time and the register R1 holds the signal off time. Setting TRUN bit starts the timer which counts down at the instruction cycle rate. The underflow toggles the TIO output and copies the off time into the timer, which continues to run. By alternately loading in the on time and the off time at each successive interrupt a PWM frequency can be easily generated.

FIGURE 10. Timer Application

## WATCHDOG

The device has an on-board 8-bit WATCHDOG timer. The timer contains an 8-bit READ/WRITE down counter clocked by an 8-bit prescaler. Under software control the timer can

be dedicated for the WATCHDOG or used as a general purpose counter. *Figure 11* shows the WATCHDOG timer block diagram.

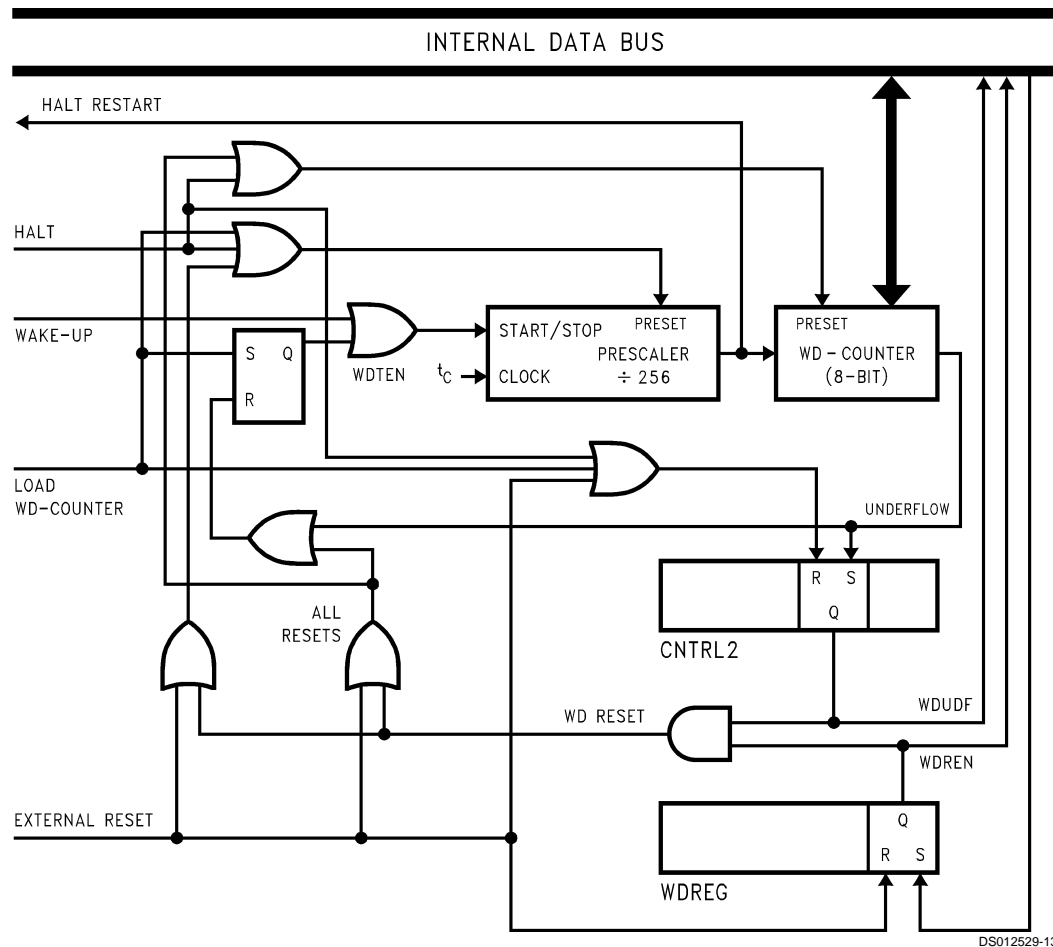

FIGURE 11. WATCHDOG Timer Block Diagram

### MODE 1: WATCHDOG TIMER

The WATCHDOG is designed to detect user programs getting stuck in infinite loops resulting in loss of program control or “runaway” programs. The WATCHDOG can be enabled or disabled (only once) after the device is reset as a result of external reset. On power-up the WATCHDOG is disabled. The WATCHDOG is enabled by writing a “1” to WDREN bit (resides in WDREG register). Once enabled, the user program should write periodically into the 8-bit counter before the counter underflows. The 8-bit counter (WDCNT) is memory mapped at address 0CE Hex. The counter is loaded with n-1 to get n counts. The counter underflow resets the device, but does not disable the WATCHDOG. Loading the 8-bit counter initializes the prescaler with FF Hex and starts the prescaler/counter. Prescaler and counter are stopped upon counter underflow. Prescaler and counter are each loaded with FF Hex when the device goes into the HALT mode. The prescaler is used for crystal/resonator start-up when the device exits the HALT mode through Multi-Input Wakeup. In this case, the prescaler/counter contents are changed.

### MODE 2: TIMER

In this mode, the prescaler/counter is used as a timer by keeping the WDREN (WATCHDOG reset enable) bit at 0. The counter underflow sets the WDUDF (underflow) bit and the underflow does not reset the device. Loading the 8-bit counter (load n-1 for n counts) sets the WDTEN bit (WATCHDOG Timer Enable) to “1”, loads the prescaler with FF, and starts the timer. The counter underflow stops the timer. The WDTEN bit serves as a start bit for the WATCHDOG timer. This bit is set when the 8-bit counter is loaded by the user program. The load could be as a result of WATCHDOG service (WATCHDOG timer dedicated for WATCHDOG function) or write to the counter (WATCHDOG timer used as a general purpose counter). The bit is cleared upon Brown Out reset, WATCHDOG reset or external reset. The bit is not memory mapped and is transparent to the user program.

### CONTROL/STATUS BITS

WDUDF: WATCHDOG Timer Underflow Bit

This bit resides in the CNTRL2 Register. The bit is set when the WATCHDOG timer underflows. The underflow resets the device if the WATCHDOG reset enable bit is set (WDREN = 1). Otherwise, WDUDF can be used as the timer underflow

## WATCHDOG (Continued)

flag. The bit is cleared upon external reset, load to the 8-bit counter, or going into the HALT mode. It is a read only bit.

WDREN: WD Reset Enable

WDREN bit resides in a separate register (bit 0 of WDREG). This bit enables the WATCHDOG timer to generate a reset. The bit is cleared upon external reset. The bit under software

control can be written to only once (once written to, the hardware does not allow the bit to be changed during program execution).

WDREN = 1 WATCHDOG reset is enabled.

WDREN = 0 WATCHDOG reset is disabled.

Table 6 shows the impact of WATCHDOG Reset and External Reset on the Control/Status bits.

**TABLE 6. WATCHDOG Control/Status**

| Parameter        | HALT Mode | WD Reset  | EXT Reset | Counter Load |
|------------------|-----------|-----------|-----------|--------------|
| 8-Bit Prescaler  | FF        | FF        | FF        | FF           |
| 8-Bit WD Counter | FF        | FF        | FF        | User Value   |
| WDREN Bit        | Unchanged | Unchanged | 0         | No Effect    |
| WDUDF Bit        | 0         | Unchanged | 0         | 0            |
| WDTEN Signal     | Unchanged | 0         | 0         | 1            |

## Modulator/Timer

The Modulator/Timer contains an 8-bit counter and an 8-bit autoreload register (MODRL address 0CF Hex). The Modulator/Timer has two modes of operation, selected by the control bit MC3. The Modulator/Timer Control bits MC1, MC2 and MC3 reside in CNTRL2 Register.

### MODE 1: MODULATOR

The Modulator is used to generate high frequency pulses on the modulator output pin (L7). The L7 pin should be configured as an output. The number of pulses is determined by the 8-bit down counter. Under software control the modulator input clock can be either CKI or tC. The tC clock is derived by dividing down the oscillator clock by a factor of 10. Three control bits (MC1, MC2, and MC3) are used for the Modulator/Timer output control. When MC2 = 1 and MC3 = 1, CKI is used as the modulator input clock. When MC2 = 0, and MC3 = 1, tC is used as the modulator input clock. The user loads the counter with the desired number of counts (256 max) and sets MC1 to start the counter. The modulator autoreload register is loaded with n-1 to get n pulses. CKI or tC pulses are routed to the modulator output (L7) until the counter underflows (Figure 12). Upon underflow the hardware resets MC1 and stops the counter. The L7 pin goes low and stays low until the counter is restarted by the user program. The user program has the responsibility to timeout the low time. Unless the number of counts is changed, the user program does not have to load the counter each time the counter is started. The counter can simply be started by setting the MC1 bit. Setting MC1 by software will load the counter with the value of the autoreload register. The software can reset MC1 to stop the counter.

### MODE 2: PWM TIMER

The counter can also be used as a PWM Timer. In this mode, an 8-bit register is used to serve as an autoreload register (MODRL).

#### a. 50% Duty Cycle:

When MC1 is 1 and MC2, MC3 are 0, a 50% duty cycle free running signal is generated on the L7 output pin (Figure 13). The L7 pin must be configured as an output pin. In this mode the 8-bit counter is clocked by tC. Setting the MC1 control bit

by software loads the counter with the value of the autoreload register and starts the counter. The counter underflow toggles the (L7) output pin. The 50% duty cycle signal will be continuously generated until MC1 is reset by the user program.

#### b. Variable Duty Cycle:

When MC3 = 0 and MC2 = 1, a variable duty cycle PWM signal is generated on the L7 output pin. The counter is clocked by tC. In this mode the 16-bit timer T1 along with the 8-bit down counter are used to generate a variable duty cycle PWM signal. The timer T1 underflow sets MC1 which starts the down counter and it also sets L7 high (L7 should be configured as an output). When the counter underflows the MC1 control bit is reset and the L7 output will go low until the next timer T1 underflow. Therefore, the width of the output pulse is controlled by the 8-bit counter and the pulse duration is controlled by the 16-bit timer T1 (Figure 14). Timer T1 must be configured in "PWM Mode/Toggle TIO Out" (CNTRL1 Bits 7,6,5 = 101).

Table 7 shows the different operation modes for the Modulator/Timer.

**TABLE 7. Modulator/Timer Modes**

| Control Bits in CNTRL2(00CC) |     |     | Operation Mode L7 Function                                       |
|------------------------------|-----|-----|--|
| MC3                          | MC2 | MC1 |  |
| 0                            | 0   | 0   | Normal I/O   |
| 0                            | 0   | 1   | 50% Duty Cycle Mode (Clocked by tC)                              |
| 0                            | 1   | X   | Variable Duty Cycle Mode (Clocked by tC) Using Timer 1 Underflow |
| 1                            | 0   | X   | Modulator Mode (Clocked by tC)                                   |
| 1                            | 1   | X   | Modulator Mode (Clocked by CKI)                                  |

**Note:** MC1, MC2 and MC3 control bits are cleared upon reset.

## Comparator

The device has one differential comparator. Ports L0–L2 are used for the comparator. The output of the comparator is brought out to a pin. Port L has the following assignments:

- L0 Comparator output
- L1 Comparator negative input
- L2 Comparator positive input

### THE COMPARATOR STATUS/CONTROL BITS

These bits reside in the CNTRL2 Register (Address 0CC)

- CMPEM Enables comparator ("1" = enable)
- CMPRD Reads comparator output internally

(CMPEN = 1, CMPOE=X)

CMPOE Enables comparator output to pin L0 ("1"=enable), CMPEN bit must be set to enable this function. If CMPEN=0, L0 will be 0.

The Comparator Select/Control bits are cleared on RESET (the comparator is disabled). To save power the program should also disable the comparator before the device enters the HALT mode.

The user program must set up L0, L1 and L2 ports correctly for comparator Inputs/Output: L1 and L2 need to be configured as inputs and L0 as output. Table 8 shows the DC and AC characteristics for the comparator.

TABLE 8. DC and AC Characteristics (Note 8)  $4.5V \leq V_{CC} \leq 5.5V$ ,  $-40^{\circ}C \leq T_A \leq +85^{\circ}C$

| Parameters                       | Conditions                                    | Min | Typ      | Max            | Units   |
|----------------------------------|---|-----|----------|----------------|---------|
| Input Offset Voltage             | $0.4V < V_{IN} < V_{CC} - 1.5V$               |     | $\pm 10$ | $\pm 25$       | mV      |
| Input Common Mode Voltage Range  |   | 0.4 |          | $V_{CC} - 1.5$ | V       |

**Note 8:** For comparator output current characteristics see L-Port specs.

## Multi-Input Wake Up

The Multi-Input Wakeup feature is used to return (wakeup) the device from the HALT mode. Figure 15 shows the Multi-Input Wakeup logic.

This feature utilizes the L Port. The user selects which particular L port bit or combination of L Port bits will cause the device to exit the HALT mode. Three 8-bit memory mapped

registers, Reg:WKEN, Reg:WKEDG, and Reg:WKPND are used in conjunction with the L port to implement the Multi-Input Wakeup feature.

All three registers Reg:WKEN, Reg:WKPND, and Reg:WKEDG are read/write registers, and are cleared at reset, except WKPND. WKPND is unknown on reset.

The user can select whether the trigger condition on the selected L Port pin is going to be either a positive edge (low to high transition) or a negative edge (high to low transition).

## Multi-Input Wake Up (Continued)

This selection is made via the Reg:WKEDG, which is an 8-bit control register with a bit assigned to each L Port pin. Setting the control bit will select the trigger condition to be a negative edge on that particular L Port pin. Resetting the bit selects the trigger condition to be a positive edge. Changing an edge select entails several steps in order to avoid a pseudo Wakeup condition as a result of the edge change. First, the associated WKEN bit should be reset, followed by the edge select change in WKEDG. Next, the associated WKPND bit should be cleared, followed by the associated WKEN bit being re-enabled.

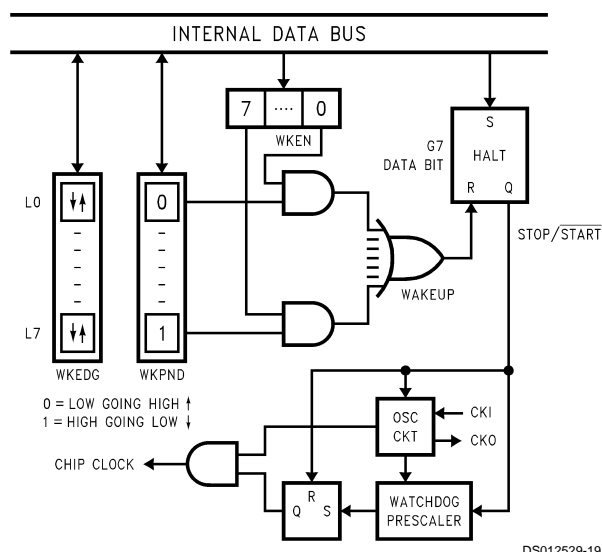

An example may serve to clarify this procedure. Suppose we wish to change the edge select from positive (low going high) to negative (high going low) for L port bit 5, where bit 5 has previously been enabled for an input. The program would be as follows:

|      |          |                        |
|------|----------|------------------------|
| RBIT | 5, WKEN  | ; Disable MIWU         |
| SBIT | 5, WKEDG | ; Change edge polarity |
| RBIT | 5, WKPND | ; Reset pending flag   |
| SBIT | 5, WKEN  | ; Enable MIWU          |

If the L port bits have been used as outputs and then changed to inputs with Multi-Input Wakeup, a safety procedure should also be followed to avoid inherited pseudo wakeup conditions. After the selected L port bits have been changed from output to input but before the associated WKEN bits are enabled, the associated edge select bits in WKEDG should be set or reset for the desired edge selects, followed by the associated WKPND bits being cleared. This same procedure should be used following RESET, since the L port inputs are left floating as a result of RESET.

The occurrence of the selected trigger condition for Multi-Input Wakeup is latched into a pending register called Reg:WKPND. The respective bits of the WKPND register will be set on the occurrence of the selected trigger edge on the corresponding Port L pin. The user has the responsibility of clearing these pending flags. Since the Reg:WKPND is a pending register for the occurrence of selected wakeup conditions, the device will not enter the HALT mode if any Wakeup bit is both enabled and pending. Setting the G7 data bit under this condition will not allow the device to enter the HALT mode. Consequently, the user has the responsibility of clearing the pending flags before attempting to enter the HALT mode.

If a crystal oscillator is being used, the Wakeup signal will not start the chip running immediately since crystal oscillators have a finite start up time. The WATCHDOG timer prescaler generates a fixed delay to ensure that the oscillator has indeed stabilized before allowing the device to execute instructions. In this case, upon detecting a valid Wakeup signal only the oscillator circuitry and the WATCHDOG timer are enabled. The WATCHDOG timer prescaler is loaded with a value of FF Hex (256 counts) and is clocked from the tc instruction cycle clock. The tc clock is derived by dividing down the oscillator clock by a factor of 10. A Schmitt trigger following the CKI on chip inverter ensures that the WATCHDOG timer is clocked only when the oscillator has a sufficiently large amplitude to meet the Schmitt trigger specs. This Schmitt trigger is not part of the oscillator closed loop. The startup timeout from the WATCHDOG timer enables the clock signals to be routed to the rest of the chip.

**FIGURE 15. Multi-Input Wakeup Logic**

## INTERRUPTS

The device has a sophisticated interrupt structure to allow easy interface to the real world. There are three possible interrupt sources, as shown below.

A maskable interrupt on external G0 input (positive or negative edge sensitive under software control)

A maskable interrupt on timer carry or timer capture

A non-maskable software/error interrupt on opcode zero

## INTERRUPT CONTROL

The GIE (global interrupt enable) bit enables the interrupt function. This is used in conjunction with ENI and ENTI to select one or both of the interrupt sources. This bit is reset when interrupt is acknowledged.

ENI and ENTI bits select external and timer interrupts respectively. Thus the user can select either or both sources to interrupt the microcontroller when GIE is enabled.

IEDG selects the external interrupt edge (0 = rising edge, 1 = falling edge). The user can get an interrupt on both rising and falling edges by toggling the state of IEDG bit after each interrupt.

IPND and TPND bits signal which interrupt is pending. After an interrupt is acknowledged, the user can check these two bits to determine which interrupt is pending. This permits the interrupts to be prioritized under software. The pending flags have to be cleared by the user. Setting the GIE bit high inside the interrupt subroutine allows nested interrupts.

The software interrupt does not reset the GIE bit. This means that the controller can be interrupted by other interrupt sources while servicing the software interrupt.

## INTERRUPT PROCESSING

The interrupt, once acknowledged, pushes the program counter (PC) onto the stack and the stack pointer (SP) is decremented twice. The Global Interrupt Enable (GIE) bit is reset to disable further interrupts. The microcontroller then vectors to the address 00FFH and resumes execution from that address. This process takes 7 cycles to complete. At the end of the interrupt subroutine, any of the following three instructions return the processor back to the main program: RET, RETSK or RETI. Either one of the three instructions will

## Multi-Input Wake Up (Continued)

pop the stack into the program counter (PC). The stack pointer is then incremented twice. The RETI instruction additionally sets the GIE bit to re-enable further interrupts.

Any of the three instructions can be used to return from a hardware interrupt subroutine. The RETSK instruction should be used when returning from a software interrupt subroutine to avoid entering an infinite loop.

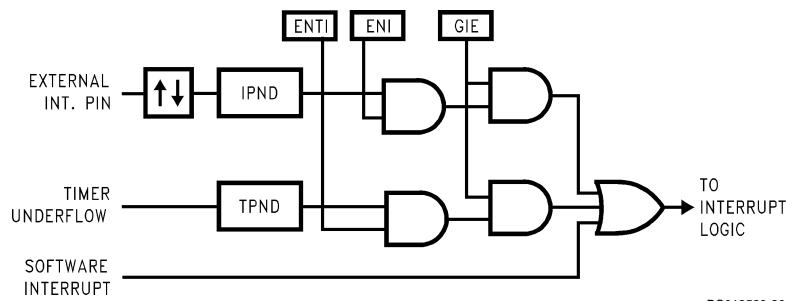

**Note:** There is always the possibility of an interrupt occurring during an instruction which is attempting to reset the GIE bit or any other interrupt enable bit. If this occurs when a single cycle instruction is being used to reset the interrupt enable bit, the interrupt enable bit will be reset but an interrupt may still occur. This is because interrupt processing is started at the same time as the interrupt bit is being reset. To avoid this scenario, the user should always use a two, three, or four cycle instruction to reset interrupt enable bits.

## DETECTION OF ILLEGAL CONDITIONS

The device incorporates a hardware mechanism that allows it to detect illegal conditions which may occur from coding errors, noise, and "brown out" voltage drop situations. Specifically, it detects cases of executing out of undefined ROM area and unbalanced tack situations.

Reading an undefined ROM location returns 00 (hexadecimal) as its contents. The opcode for a software interrupt is also "00". Thus a program accessing undefined ROM will cause a software interrupt.

Reading an undefined RAM location returns an FF (hexadecimal). The subroutine stack on the device grows down for each subroutine call. By initializing the stack pointer to the top of RAM, the first unbalanced return instruction will cause the stack pointer to address undefined RAM. As a result the program will attempt to execute from FFFF (hexadecimal), which is an undefined ROM location and will trigger a software interrupt.

## Control Registers

### CNTRL1 REGISTER (ADDRESS 00EE)

| TC3   | TC2 | TC1 | TRUN | MSEL  | IEDG | SL1 | SL0 |
|-------|-----|-----|------|-------|------|-----|-----|
| Bit 7 |     |     |      | Bit 0 |      |     |     |

The Timer and MICROWIRE control register contains the following bits:

|             |  |
|-------------|--|
| TC3         | Timer T1 Mode Control Bit  |
| TC2         | Timer T1 Mode Control Bit  |
| TC1         | Timer T1 Mode Control Bit  |
| TRUN        | Used to start and stop the timer/counter<br>(1 = run, 0 = stop)  |
| MSEL        | Selects G5 and G4 as MICROWIRE signals<br>SK and SO respectively |
| IEDG        | External interrupt edge polarity select                          |
| SL1 and SL0 | Select the MICROWIRE clock divide-by<br>(00 = 2, 01 = 4, 1x = 8) |

### PSW REGISTER (ADDRESS 00EF)

| HC    | C | TPND | ENTI | IPND  | BUSY | ENI | GIE |
|-------|---|------|------|-------|------|-----|-----|
| Bit 7 |   |      |      | Bit 0 |      |     |     |

The PSW register contains the following select bits:

|      |   |
|------|---|
| HC   | Half-Carry Flip/Flop  |
| C    | Carry Flip/Flop   |
| TPND | Timer T1 interrupt pending<br>(timer Underflow or capture edge) |
| ENTI | Timer T1 interrupt enable                                       |

|      |  |
|------|--|
| IPND | External interrupt pending                   |
| BUSY | MICROWIRE busy shifting flag                 |
| ENI  | External interrupt enable                    |
| GIE  | Global interrupt enable (enables interrupts) |

The Half-Carry bit is also effected by all the instructions that effect the Carry flag. The flag values depend upon the instruction. For example, after executing the ADC instruction the values of the Carry and the Half-Carry flag depend upon the operands involved. However, instructions like SET C and RESET C will set and clear both the carry flags. *Table \*NO TARGET FOR table NS2079\** lists the instructions that effect the HC and the C flags.

TABLE 9. Instructions Effecting HC and C Flags

| Instr.  | HC Flag             | C Flag              |
|---------|---------------------|---------------------|
| ADC     | Depends on Operands | Depends on Operands |
| SUBC    | Depends on Operands | Depends on Operands |
| SET C   | Set                 | Set                 |
| RESET C | Set                 | Set                 |
| RRC     | Depends on Operands | Depends on Operands |

Reading other unused memory locations will return undefined data.

## Addressing Modes

There are ten addressing modes, six for operand addressing and four for transfer of control.

### OPERAND ADDRESSING MODES

#### REGISTER INDIRECT

This is the "normal" addressing mode for the chip. The operand is the data memory addressed by the **B** or **X** pointer.

#### REGISTER INDIRECT WITH AUTO POST INCREMENT OR DECREMENT

This addressing mode is used with the LD and X instructions. The operand is the data memory addressed by the **B** or **X** pointer. This is a register indirect mode that automatically post increments or post decrements the **B** or **X** pointer after executing the instruction.

#### DIRECT

The instruction contains an 8-bit address field that directly points to the data memory for the operand.

#### IMMEDIATE

The instruction contains an 8-bit immediate field as the operand.

#### SHORT IMMEDIATE

This addressing mode issued with the LD B,# instruction, where the immediate # is less than 16. The instruction contains a 4-bit immediate field as the operand.

#### INDIRECT

This addressing mode is used with the LAID instruction. The contents of the accumulator are used as a partial address (lower 8 bits of PC) for accessing a data operand from the program memory.

### TRANSFER OF CONTROL ADDRESSING MODES

#### RELATIVE

This mode is used for the JP instruction with the instruction field being added to the program counter to produce the next instruction address. JP has a range from -31 to +32 to allow a one byte relative jump (JP + 1 is implemented by a NOP instruction). There are no "blocks" or "pages" when using JP since all 15 bits of the PC are used.

#### ABSOLUTE

## Addressing Modes (Continued)

This mode is used with the JMP and JSR instructions with the instruction field of 12 bits replacing the lower 12 bits of the program counter (PC). This allows jumping to any location in the current 4k program memory segment.

### ABSOLUTE LONG

This mode is used with the JMPL and JSRL instructions with the instruction field of 15 bits replacing the entire 15 bits of the program counter (PC). This allows jumping to any location up to 32k in the program memory space.

### INDIRECT

This mode is used with the JID instruction. The contents of the accumulator are used as a partial address (lower 8 bits of PC) for accessing a location in the program memory. The contents of this program memory location serves as a partial address (lower 8 bits of PC) for the jump to the next instruction.

## Instruction Set

### REGISTER AND SYMBOL DEFINITIONS

#### Registers

|     |   |
|-----|---|
| A   | 8-bit Accumulator register                        |
| B   | 8-bit Address register                            |
| X   | 8-bit Address register                            |
| SP  | 8-bit Stack pointer register                      |
| PC  | 15-bit Program counter register                   |
| PU  | upper 7 bits of PC                                |
| PL  | lower 8 bits of PC                                |
| C   | 1-bit of PSW register for carry                   |
| HC  | Half Carry  |
| GIE | 1-bit of PSW register for global interrupt enable |

#### Symbols

|      |  |
|------|--|
| [B]  | Memory indirectly addressed by B register                  |
| [X]  | Memory indirectly addressed by X register                  |
| Mem  | Direct address memory or [B]                               |
| Meml | Direct address memory or [B] or Immediate data             |
| Imm  | 8-bit Immediate data                                       |
| Reg  | Register memory: addresses F0 to FF (Includes B, X and SP) |
| Bit  | Bit number (0 to 7)  |
| ←    | Loaded with  |
| ↔    | Exchanged with   |

**Instruction Set** (Continued)**INSTRUCTION SET**

|        |                              |   |
|--------|------------------------------|---|
| ADD    | add                          | $A \leftarrow A + \text{MemI}$  |
| ADC    | add with carry               | $A \leftarrow A + \text{MemI} + C$ , $C \leftarrow \text{Carry}$<br>$\text{HC} \leftarrow \text{Half Carry}$                      |
| SUBC   | subtract with carry          | $A \leftarrow A + \overline{\text{MemI}} + C$ , $C \leftarrow \text{Carry}$<br>$\text{HC} \leftarrow \text{Half Carry}$           |
| AND    | Logical AND                  | $A \leftarrow A \text{ and } \text{MemI}$   |
| OR     | Logical OR                   | $A \leftarrow A \text{ or } \text{MemI}$  |
| XOR    | Logical Exclusive-OR         | $A \leftarrow A \text{ xor } \text{MemI}$   |
| IFEQ   | IF equal                     | Compare A and MemI, Do next if $A = \text{MemI}$  |
| IFGT   | IF greater than              | Compare A and MemI, Do next if $A > \text{MemI}$  |
| IFBNE  | IF B not equal               | Do next if lower 4 bits of $B \neq \text{Imm}$  |
| DRSZ   | Decrement Reg. ,skip if zero | $\text{Reg} \leftarrow \text{Reg} - 1$ , skip if Reg goes to 0  |
| SBIT   | Set bit                      | 1 to bit, Mem (bit= 0 to 7 immediate)   |
| RBIT   | Reset bit                    | 0 to bit, Mem   |
| IFBIT  | If bit                       | If bit, Mem is true, do next instr.   |
| X      | Exchange A with memory       | $A \leftrightarrow \text{Mem}$  |
| LD A   | Load A with memory           | $A \leftarrow \text{MemI}$  |
| LD mem | Load Direct memory Immed.    | $\text{Mem} \leftarrow \text{Imm}$  |
| LD Reg | Load Register memory Immed.  | $\text{Reg} \leftarrow \text{Imm}$  |
| X      | Exchange A with memory [B]   | $A \leftrightarrow [B]$ ( $B \leftarrow B \pm 1$ )  |
| X      | Exchange A with memory [X]   | $A \leftrightarrow [X]$ ( $X \leftarrow X \pm 1$ )  |
| LD A   | Load A with memory [B]       | $A \leftarrow [B]$ ( $B \leftarrow B \pm 1$ )   |
| LD A   | Load A with memory [X]       | $A \leftarrow [X]$ ( $X \leftarrow X \pm 1$ )   |
| LD M   | Load Memory Immediate        | $[B] \leftarrow \text{Imm}$ ( $B \leftarrow B \pm 1$ )  |
| CLRA   | Clear A                      | $A \leftarrow 0$  |
| INCA   | Increment A                  | $A \leftarrow A + 1$  |
| DECA   | Decrement A                  | $A \leftarrow A - 1$  |
| LAID   | Load A indirect from ROM     | $A \leftarrow \text{ROM}(\text{PU}, A)$   |
| DCORA  | DECIMAL CORRECT A            | $A \leftarrow \text{BCD correction (follows ADC, SUBC)}$  |
| RRCA   | ROTATE A RIGHT THRU C        | $C \rightarrow A7 \rightarrow \dots \rightarrow A0 \rightarrow C$   |
| SWAPA  | Swap nibbles of A            | $A7 \dots A4 \leftrightarrow A3 \dots A0$   |
| SC     | Set C                        | $C \leftarrow 1$ , $\text{HC} \leftarrow 1$   |
| RC     | Reset C                      | $C \leftarrow 0$ , $\text{HC} \leftarrow 0$   |
| IFC    | If C                         | If C is true, do next instruction   |
| IFNC   | If not C                     | If C is not true, do next instruction   |
| JMPL   | Jump absolute long           | $\text{PC} \leftarrow \text{ii}$ ( $\text{ii} = 15 \text{ bits}$ , 0 to 32k)  |
| JMP    | Jump absolute                | $\text{PC}11..0 \leftarrow \text{i}$ ( $\text{i} = 12 \text{ bits}$ )   |
| JP     | Jump relative short          | $\text{PC} \leftarrow \text{PC} + \text{r}$ ( $\text{r}$ is -31 to +32, not 1)  |
| JSRL   | Jump subroutine long         | $[\text{SP}] \leftarrow \text{PL}$ , $[\text{SP}-1] \leftarrow \text{PU}$ , $\text{SP}-2$ , $\text{PC} \leftarrow \text{ii}$      |
| JSR    | Jump subroutine              | $[\text{SP}] \leftarrow \text{PL}$ , $[\text{SP}-1] \leftarrow \text{PU}$ , $\text{SP}-2$ , $\text{PC}11.. 0 \leftarrow \text{i}$ |
| JID    | Jump indirect                | $\text{PL} \leftarrow \text{ROM}(\text{PU}, A)$   |
| RET    | Return from subroutine       | $\text{SP}+2, \text{PL} \leftarrow [\text{SP}]$ , $\text{PU} \leftarrow [\text{SP}-1]$  |
| RETSK  | Return and Skip              | $\text{SP}+2, \text{PL} \leftarrow [\text{SP}]$ , $\text{PU} \leftarrow [\text{SP}-1]$ , Skip next instruction                    |
| RETI   | Return from Interrupt        | $\text{SP}+2, \text{PL} \leftarrow [\text{SP}]$ , $\text{PU} \leftarrow [\text{SP}-1]$ , $\text{GIE} \leftarrow 1$                |
| INTR   | Generate an interrupt        | $[\text{SP}] \leftarrow \text{PL}$ , $[\text{SP}-1] \leftarrow \text{PU}$ , $\text{SP}-2$ , $\text{PC} \leftarrow \text{OFF}$     |
| NOP    | No operation                 | $\text{PC} \leftarrow \text{PC} + 1$  |

where,  
i is the immediate data  
M<sub>d</sub> is a directly addressed memory location  
\* is an unused opcode (see following table)

## Instruction Execution Time

Most instructions are single byte (with immediate addressing mode instruction taking two bytes).

Most single instructions take one cycle time to execute.

Skipped instructions require x number of cycles to be skipped, where x equals the number of bytes in the skipped instruction opcode.

See the BYTES and CYCLES per INSTRUCTION table for details.

## BYTES and CYCLES per INSTRUCTION

The following table shows the number of bytes and cycles for each instruction in the format of byte/cycle.

### Arithmetic Instructions (Bytes/Cycles)

|       | [B] | Direct | Immed. |
|-------|-----|--------|--------|
| ADD   | 1/1 | 3/4    | 2/2    |
| ADC   | 1/1 | 3/4    | 2/2    |
| SUBC  | 1/1 | 3/4    | 2/2    |
| AND   | 1/1 | 3/4    | 2/2    |
| OR    | 1/1 | 3/4    | 2/2    |
| XOR   | 1/1 | 3/4    | 2/2    |
| IFEQ  | 1/1 | 3/4    | 2/2    |
| IFGT  | 1/1 | 3/4    | 2/2    |
| IFBNE | 1/1 |        |        |
| DRSZ  |     | 1/3    |        |
| SBIT  | 1/1 | 3/4    |        |
| RBIT  | 1/1 | 3/4    |        |
| IFBIT | 1/1 | 3/4    |        |

### Memory Transfer Instructions (Bytes/Cycles)

|            | Register Indirect<br>[B] [X] | Direct | Immed. | Register Indirect Auto Incr & Decr<br>[B+, B-] [X+, X-] |             |
|------------|------------------------------|--------|--------|---|-------------|
| X A,*      | 1/1 1/3                      | 2/3    |        | 1/2 1/3   |             |
| LD A,*     | 1/1 1/3                      | 2/3    | 2/2    | 1/2 1/3   |             |
| LD B,Imm   |                              |        | 1/1    |   | (If B < 16) |
| LD B,Imm   |                              |        | 2/3    |   | (If B > 15) |
| LD Mem,Imm |                              | 3/3    |        | 2/2   |             |
| LD Reg,Imm |                              |        | 2/3    |   |             |

\* = > Memory location addressed by B or X or directly.

### Instructions Using A & C

| Instructions | Bytes/Cycles |
|--------------|--------------|
| CLRA         | 1/1          |
| INCA         | 1/1          |
| DECA         | 1/1          |
| LAID         | 1/3          |
| DCORA        | 1/1          |
| RRCA         | 1/1          |
| SWAPA        | 1/1          |
| SC           | 1/1          |
| RC           | 1/1          |
| IFC          | 1/1          |
| IFNC         | 1/1          |

### Transfer of Control Instructions

| Instructions | Bytes/Cycles |
|--------------|--------------|

| NOP          | 1/1          |

## Development Tools Support

### OVERVIEW

National is engaged with an international community of independent 3rd party vendors who provide hardware and software development tool support. Through National's interaction and guidance, these tools cooperate to form a choice of solutions that fits each developer's needs.

This section provides a summary of the tool and development kits currently available. Up-to-date information, selection guides, free tools, demos, updates, and purchase information can be obtained at our web site at: [www.national.com/cop8](http://www.national.com/cop8).

### SUMMARY OF TOOLS

#### COP8 Evaluation Tools

- **COP8–NSEVAL:** Free Software Evaluation package for Windows. A fully integrated evaluation environment for COP8, including versions of WCOP8 IDE (Integrated Development Environment), COP8-NSASM, COP8-MLSIM, COP8C, DriveWay™ COP8, Manuals, and other COP8 information.
- **COP8–MLSIM:** Free Instruction Level Simulator tool for Windows. For testing and debugging software instructions only (No I/O or interrupt support).
- **COP8–EPU:** Very Low cost COP8 Evaluation & Programming Unit. Windows based evaluation and hardware-simulation tool, with COP8 device programmer and erasable samples. Includes COP8-NSDEV, DriveWay COP8 Demo, MetaLink Debugger, I/O cables and power supply.
- **COP8–EVAL-ICUxx:** Very Low cost evaluation and design test board for COP8ACC and COP8SGx Families, from ICU. Real-time environment with add-on A/D, D/A, and EEPROM. Includes software routines and reference designs.
- **Manuals, Applications Notes, Literature:** Available free from our web site at: [www.national.com/cop8](http://www.national.com/cop8).

#### COP8 Integrated Software/Hardware Design Development Kits

- **COP8-EPU:** Very Low cost Evaluation & Programming Unit. Windows based development and hardware-simulation tool for COPSx/xG families, with COP8 device programmer and samples. Includes COP8-NSDEV, DriveWay COP8 Demo, MetaLink Debugger, cables and power supply.
- **COP8-DM:** Moderate cost Debug Module from MetaLink. A Windows based, real-time in-circuit emulation tool with COP8 device programmer. Includes COP8-NSDEV, DriveWay COP8 Demo, MetaLink Debugger, power supply, emulation cables and adapters.

#### COP8 Development Languages and Environments

- **COP8-NSASM:** Free COP8 Assembler v5 for Win32. Macro assembler, linker, and librarian for COP8 software development. Supports all COP8 devices. (DOS/Win16 v4.10.2 available with limited support). (Compatible with WCOP8 IDE, COP8C, and DriveWay COP8).
- **COP8-NSDEV:** Very low cost Software Development Package for Windows. An integrated development environment for COP8, including WCOP8 IDE, COP8-NSASM, COP8-MLSIM.

- **COP8C:** Moderately priced C Cross-Compiler and Code Development System from Byte Craft (no code limit). Includes BCLIDE (Byte Craft Limited Integrated Development Environment) for Win32, editor, optimizing C Cross-Compiler, macro cross assembler, BC-Linker, and MetaLink tools support. (DOS/SUN versions available; Compiler is installable under WCOP8 IDE; Compatible with DriveWay COP8).
- **EW COP8-KS:** Very Low cost ANSI C-Compiler and Embedded Workbench from IAR (Kickstart version: COP8Sx/Fx only with 2k code limit; No FP). A fully integrated Win32 IDE, ANSI C-Compiler, macro assembler, editor, linker, Librarian, C-Spy simulator/debugger, PLUS MetaLink EPU/DM emulator support.
- **EW COP8-AS:** Moderately priced COP8 Assembler and Embedded Workbench from IAR (no code limit). A fully integrated Win32 IDE, macro assembler, editor, linker, librarian, and C-Spy high-level simulator/debugger with I/O and interrupts support. (Upgradeable with optional C-Compiler and/or MetaLink Debugger/Emulator support).
- **EW COP8-BL:** Moderately priced ANSI C-Compiler and Embedded Workbench from IAR (Baseline version: All COP8 devices; 4k code limit; no FP). A fully integrated Win32 IDE, ANSI C-Compiler, macro assembler, editor, linker, librarian, and C-Spy high-level simulator/debugger. (Upgradeable; CWCOP8-M MetaLink tools interface support optional).
- **EW COP8:** Full featured ANSI C-Compiler and Embedded Workbench for Windows from IAR (no code limit). A fully integrated Win32 IDE, ANSI C-Compiler, macro assembler, editor, linker, librarian, and C-Spy high-level simulator/debugger. (CWCOP8-M MetaLink tools interface support optional).
- **EW COP8-M:** Full featured ANSI C-Compiler and Embedded Workbench for Windows from IAR (no code limit). A fully integrated Win32 IDE, ANSI C-Compiler, macro assembler, editor, linker, librarian, C-Spy high-level simulator/debugger, PLUS MetaLink debugger/hardware interface (CWCOP8-M).

#### COP8 Productivity Enhancement Tools

- **WCOP8 IDE:** Very Low cost IDE (Integrated Development Environment) from KKD. Supports COP8C, COP8-NSASM, COP8-MLSIM, DriveWay COP8, and MetaLink debugger under a common Windows Project Management environment. Code development, debug, and emulation tools can be launched from the project window framework.
- **DriveWay-COP8:** Low cost COP8 Peripherals Code Generation tool from Aisys Corporation. Automatically generates tested and documented C or Assembly source code modules containing I/O drivers and interrupt handlers for each on-chip peripheral. Application specific code can be inserted for customization using the integrated editor. (Compatible with COP8-NSASM, COP8C, and WCOP8 IDE.)
- **COP8-UTILS:** Free set of COP8 assembly code examples, device drivers, and utilities to speed up code development.
- **COP8-MLSIM:** Free Instruction Level Simulator tool for Windows. For testing and debugging software instructions only (No I/O or interrupt support).

## Development Tools Support

(Continued)

### COP8 Real-Time Emulation Tools

- **COP8-DM:** MetaLink Debug Module. A moderately priced real-time in-circuit emulation tool, with COP8 device programmer. Includes COP8-NSDEV, DriveWay COP8 Demo, MetaLink Debugger, power supply, emulation cables and adapters.
- **IM-COP8:** MetaLink iceMASTER®. A full featured, real-time in-circuit emulator for COP8 devices. Includes MetaLink Windows Debugger, and power supply. Package-specific probes and surface mount adaptors are ordered separately.

### COP8 Device Programmer Support

- MetaLink's EPU and Debug Module include development device programming capability for COP8 devices.
- Third-party programmers and automatic handling equipment cover needs from engineering prototype and pilot production, to full production environments.
- Factory programming available for high-volume requirements.

### TOOLS ORDERING NUMBERS FOR THE COP87L20CJ/COP87L40CJ FAMILY DEVICES

| Vendor          | Tools                    | Order Number  | Cost  | Notes  |
|-----------------|--------------------------|---|-------|--|
| National        | COP8-NSEVAL              | COP8-NSEVAL   | Free  | Web site download  |
|                 | COP8-NSASM               | COP8-NSASM  | Free  | Included in EPU and DM. Web site download  |
|                 | COP8-MLSIM               | COP8-MLSIM  | Free  | Included in EPU and DM. Web site download  |
|                 | COP8-NSDEV               | COP8-NSDEV  | VL    | Included in EPU and DM. Order CD from website  |
|                 | COP8-EPU                 | Not available for this device                                   |       |  |
|                 | COP8-DM                  | Contact MetaLink  |       |  |
|                 | Development Devices      | COP87L20/40CJxx<br>COP87L22/42CJxx                              | VL    | 4k or 32k OTP devices. No windowed devices   |
|                 | OTP Programming Adapters | COP8SA-PGMA   | L     | For programming 16/20/28 SOIC and 44 PLCC on the EPU   |
|                 |                          | COP8-PGMA-44QFP   | L     | For programming 44QFP on any programmer  |
|                 |                          | COP8-PGMA-28CSP   | L     | For programming 28CSP on any programmer  |
|                 |                          | COP8-PGMA-28SO  | VL    | For programming 16/20/28 SOIC on any programmer  |
|                 | IM-COP8                  | Contact MetaLink  |       |  |
| MetaLink        | COP8-EPU                 | Not available for this device                                   |       |  |
|                 | COP8-DM                  | DM4-COP8-840CJ (10 MHz), plus PS-10, plus DM-COP8/xxx (ie. 28D) | M     | Included p/s (PS-10), target cable of choice (DIP or PLCC; i.e. DM-COP8/28D), 16/20/28/40 DIP/SO and 44 PLCC programming sockets. Add OTP adapter (if needed) and target adapter (if needed) |
|                 | DM Target Adapters       | MHW-CONVxx (xx = 33, 34 etc.)                                   | L     | DM target converters for 16DIP/20/SO/28SO/44QFP/28CSP; (MHW-CNV38 for 20 pin DIP to SO package converter)  |
|                 | OTP Programming Adapters | MHW-COP8-PGMA-DS  | L     | For programming 16/20/28 SOIC and 44 PLCC on the EPU   |
|                 | IM-COP8                  | IM-COP8-AD-464 (-220) (10 MHz maximum)                          | H     | Base unit 10 MHz; -220 = 220V; add probe card (required) and target adapter (if needed); included software and manuals   |
|                 |                          | PC-840CJxxDW-AD-10 (xx = 20 or 28)                              | M     | 10 MHz 20 or 28 DIP probe card; 2.5V to 6.0V   |
|                 | IM Probe Target Adapter  | MHW-SOICxx (xx = 16, 20, 28)                                    | L     | 16 or 20 or 28 pin SOIC adapter for probe card   |
| ICU or National | COP8-EVAL-ICUxx          | Not available for this device                                   |       |  |
| KKD             | WCOP8-IDE                | WCOP8-IDE   | VL    | Included in EPU and DM   |
| IAR             | EWOP8-xx                 | See summary above   | L - H | Included all software and manuals  |
| Byte Craft      | COP8C                    | COP8C   | M     | Included all software and manuals  |
| Aisys           | DriveWay COP8            | DriveWay COP8   | L     | Included all software and manuals  |

## Development Tools Support (Continued)

### LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
