# TXB0104 4-Bit Bidirectional Voltage-level Translator With Automatic Direction Sensing and $\pm 15$-kV ESD Protection 

## 1 Features

- $1.2-\mathrm{V}$ to $3.6-\mathrm{V}$ on A Port and $1.65-\mathrm{V}$ to $5.5-\mathrm{V}$ on B Port ( $\mathrm{V}_{\mathrm{CCA}} \leq \mathrm{V}_{\mathrm{CCB}}$ )
- $\mathrm{V}_{\mathrm{CC}}$ Isolation Feature: If Either $\mathrm{V}_{\mathrm{CC}}$ Input Is at GND, All Outputs Are in the High-Impedance State
- Output Enable (OE) Input Circuit Referenced to $V_{\text {CCA }}$
- Low Power Consumption, 5- $\mu \mathrm{A}$ Maximum $\mathrm{I}_{\mathrm{CC}}$
- I off Supports Partial Power-Down Mode Operation
- Latch-Up Performance Exceeds 100 mA Per JESD 78, Class II
- ESD Protection Exceeds JESD 22
- A Port:
- 2500-V Human-Body Model (A114-B)
- 1500-V Charged-Device Model (C101)
- B Port:
- $\pm 15-\mathrm{kV}$ Human-Body Model (A114-B)
- 1500-V Charged-Device Model (C101)

## 2 Applications

- Headsets
- Smartphones
- Tablets
- Desktop PC

## 3 Description

This TXB0104 4-bit noninverting translator uses two separate configurable power-supply rails. The A port is designed to track $\mathrm{V}_{\text {CCA }}$. $\mathrm{V}_{\text {CCA }}$ accepts any supply voltage from 1.2 V to 3.6 V . The B port is designed to track $\mathrm{V}_{\text {CCB }}$. $\mathrm{V}_{\mathrm{CCB}}$ accepts any supply voltage from 1.65 V to 5.5 V . This allows for universal low-voltage bidirectional translation between any of the $1.2-\mathrm{V}, 1.5-$ $\mathrm{V}, 1.8-\mathrm{V}, 2.5-\mathrm{V}, 3.3-\mathrm{V}$, and $5-\mathrm{V}$ voltage nodes. $\mathrm{V}_{\mathrm{CCA}}$ must not exceed $\mathrm{V}_{\mathrm{Ccb}}$.

When the OE input is low, all outputs are placed in the high-impedance state. To ensure the high-impedance state during power up or power down, OE must be tied to GND through a pulldown resistor The current sourcing capability of the driver determines the minimum value of the resistor.

The TXB0104 device is designed so the OE input circuit is supplied by $\mathrm{V}_{\mathrm{CCA}}$.

This device is fully specified for partial power-down applications using I OFF. The I off circuitry disables the outputs, which prevents damaging current backflow through the device when the device is powered down.

Device Information

| ${ }^{(1)}$ PART NUMBER | PACKAGE | BODY SIZE (NOM) |
| :---: | :---: | :---: |
| TXB0104RUT | UQFN (12) | $2.00 \mathrm{~mm} \times 1.70 \mathrm{~mm}$ |
| TXB0104D | SOIC (14) | $8.65 \mathrm{~mm} \times 3.91 \mathrm{~mm}$ |
| TXB0104ZXU/GXU | BGA MICROSTAR JUNIOR ${ }^{\text {TM }}$ (12) | 2.00 mm × 2.50 mm |

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.
Changes from Revision I (March 2018) to Revision J (October 2020) ..... Page

- Updated the numbering format for tables, figures, and cross-references throughout the document. .....  1
- Added NMN Package 12-Pin NFBGA pinout drawing in Pin Configuration and Functions section ..... 3
Changes from Revision H (January 2018) to Revision I (March 2018) ..... Page
- Updated Pin Functions table .....  .4
- Added Pin Assignments table for GXU and ZXU package ..... 4
- Added Pin Assignments table for YZT package .....  4
- Updated Layout Example ..... 22
Changes from Revision G (November 2014) to Revision H (January 2018) ..... Page
- Added package families to package pinout drawings in Pin Configuration and Functions section ..... 3
- Added junction temperature range in Absolute Maximum Ratingstable. ..... 5
- Changed unit from V to kV in ESD Ratings table. ..... 5
Changes from Revision F (May 2012) to Revision G (November 2014) ..... Page
- Added Pin Configuration and Functions section, Handling Rating table, Feature Description section, Device Functional Modes, Application and Implementation section, Power Supply Recommendations section, Layout section, Device and Documentation Support section, and Mechanical, Packaging, and Orderable Information section ..... 1

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)

| (1) |  | MIN | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| Supply voltage, $\mathrm{V}_{\text {CCA }}$ |  | -0.5 | 4.6 | V |
| Supply voltage, $\mathrm{V}_{\text {CCB }}$ |  | -0.5 | 6.5 |  |
| Input voltage, $\mathrm{V}_{1}$ | A port | -0.5 | 4.6 | V |
|  | B port | -0.5 | 6.5 |  |
| Voltage applied to any output in the high-impedance or power-off state, $\mathrm{V}_{\mathrm{O}}$ | A port | -0.5 | 4.6 | V |
|  | B port | -0.5 | 6.5 |  |
| Voltage applied to any output in the high or low state, $\mathrm{V}_{\mathrm{O}}{ }^{(2)}$ | A port | -0.5 | $\mathrm{V}_{\text {CCA }}+0.5$ | V |
|  | B port | -0.5 | $\mathrm{V}_{\text {CCB }}+0.5$ |  |
| Input clamp current, $\mathrm{I}_{\mathrm{IK}}$ | $\mathrm{V}_{1}<0$ |  | -50 | mA |
| Output clamp current, $\mathrm{l}_{\text {OK }}$ | $\mathrm{V}_{\mathrm{O}}<0$ |  | -50 | mA |
| Continuous output current, Io |  | -50 | 50 | mA |
| Continuous current through $\mathrm{V}_{\text {CCA }}, \mathrm{V}_{\mathrm{CCB}}$, or GND |  | -100 | 100 | mA |
| Junction temperature range, $\mathrm{T}_{J}$ |  |  | 150 | ${ }^{\circ} \mathrm{C}$ |
| Storage temperature range, $\mathrm{T}_{\text {stg }}$ |  | -65 | 150 | ${ }^{\circ} \mathrm{C}$ |

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under Section 6.3 is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) The value of $\mathrm{V}_{C C A}$ and $\mathrm{V}_{\mathrm{CCB}}$ are provided in the recommended operating conditions table.

### 6.2 ESD Ratings

|  |  |  |  | VALUE | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ${ }^{(1)}$ | A port | $\pm 2.5$ |  |
|  | Electrostatic | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ${ }^{(1)}$ | B port | $\pm 15$ |  |
| $V_{\text {(ESD) }}$ | discharge | Charged-device model (CDM), per JEDEC specification JESD22-C101 ${ }^{(2)}$ | A port | $\pm 1.5$ | V |
|  |  | Charged-device model (CDM), per JEDEC specification JESD22-C101 ${ }^{(2)}$ | B port | $\pm 1.5$ |  |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

TXB0104

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted) ${ }^{(1)(2)}$

|  |  |  |  |  | MIN | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {CCA }}$ | Supply voltage |  |  |  | 1.2 | 3.6 | V |
| $\mathrm{V}_{\text {ССв }}$ | Supply voltage |  |  |  | 1.65 | 5.5 |  |
| $\mathrm{V}_{1 H}$ | High-level input voltage | Data inputs | $\begin{aligned} & \mathrm{V}_{\mathrm{CCA}}=1.2 \mathrm{~V} \text { to } 3.6 \mathrm{~V} \\ & \mathrm{~V}_{\mathrm{CCB}}=1.65 \mathrm{~V} \text { to } 5.5 \mathrm{~V} \end{aligned}$ |  | $\mathrm{V}_{\text {CCI }} \times 0.65{ }^{(3)}$ | $\mathrm{V}_{\mathrm{CCI}}$ | V |
|  |  | OE | $\begin{aligned} & \mathrm{V}_{\mathrm{CCA}}=1.2 \mathrm{~V} \text { to } 3.6 \mathrm{~V} \\ & \mathrm{~V}_{\mathrm{CCB}}=1.65 \mathrm{~V} \text { to } 5.5 \mathrm{~V} \end{aligned}$ |  | $\mathrm{V}_{\mathrm{CCA}} \times 0.65$ | 5.5 |  |
| VIL | Low-level input voltage | Data inputs | $\begin{aligned} & \mathrm{V}_{\mathrm{CCA}}=1.2 \mathrm{~V} \text { to } 5.5 \mathrm{~V} \\ & \mathrm{~V}_{\mathrm{CCB}}=1.65 \mathrm{~V} \text { to } 5.5 \mathrm{~V} \end{aligned}$ |  | 0 | $\mathrm{V}_{\mathrm{CCI}} \times 0.35{ }^{(3)}$ | V |
|  |  | OE | $\begin{aligned} & \mathrm{V}_{\mathrm{CCA}}=1.2 \mathrm{~V} \text { to } 3.6 \mathrm{~V} \\ & \mathrm{~V}_{\mathrm{CCB}}=1.65 \mathrm{~V} \text { to } 5.5 \mathrm{~V} \end{aligned}$ |  | 0 | $\mathrm{V}_{\text {CCA }} \times 0.35$ |  |
| $\mathrm{V}_{0}$ | Voltage applied to any output in the high-impedance or power-off state | A-port | $\begin{aligned} & \mathrm{V}_{\mathrm{CCA}}=1.2 \mathrm{~V} \text { to } 3.6 \mathrm{~V} \\ & \mathrm{~V}_{\mathrm{CCB}}=1.65 \mathrm{~V} \text { to } 5.5 \mathrm{~V} \end{aligned}$ |  | 0 | 3.6 | V |
|  |  | B-port | $\begin{aligned} & \mathrm{V}_{\mathrm{CCA}}=1.2 \mathrm{~V} \text { to } 3.6 \mathrm{~V} \\ & \mathrm{~V}_{\mathrm{CCB}}=1.65 \mathrm{~V} \text { to } 5.5 \mathrm{~V} \end{aligned}$ |  | 0 | 5.5 |  |
| $\Delta t / \Delta v$ | Input transition rise or fall rate | A-port inputs | $\begin{aligned} & \mathrm{V}_{\mathrm{CCA}}=1.2 \mathrm{~V} \text { to } 3.6 \mathrm{~V} \\ & \mathrm{~V}_{\mathrm{CCB}}=1.65 \mathrm{~V} \text { to } 5.5 \mathrm{~V} \end{aligned}$ |  |  | 40 | ns/V |
|  |  | B-port inputs | $\mathrm{V}_{\mathrm{CCA}}=1.2 \mathrm{~V}$ to 3.6 V | $\mathrm{V}_{\text {CCB }}=1.65 \mathrm{~V}$ to 3.6 V |  | 40 |  |
|  |  |  |  | $\mathrm{V}_{\mathrm{CCB}}=4.5 \mathrm{~V}$ to 5.5 V |  | 30 |  |
| $\mathrm{T}_{\mathrm{A}}$ | Operating free-air temperature |  |  |  | -40 | 85 | ${ }^{\circ} \mathrm{C}$ |

(1) The $A$ and $B$ sides of an unused data $I / O$ pair must be held in the same state, that is, both at $V_{C C I}$ or both at GND.
(2) $\mathrm{V}_{\mathrm{CCA}}$ must be less than or equal to $\mathrm{V}_{\mathrm{CCB}}$ and must not exceed 3.6 V .
(3) $\mathrm{V}_{\mathrm{CCI}}$ is the supply voltage associated with the input port.

### 6.18 Typical Characteristics

Figure 6-3. Capacitance for B Port I/O Pins ( $\mathrm{C}_{\mathrm{io}}$ ) vs Power Supply ( $\mathrm{V}_{\mathrm{CCB}}$ )

## 7 Parameter Measurement Information

Unless otherwise noted, all input pulses are supplied by generators that have the following characteristics:

- PRR 10 MHz
- $\mathrm{Z}_{\mathrm{O}}=50 \mathrm{~W}$
- $\mathrm{dv} / \mathrm{dt} \geq 1 \mathrm{~V} / \mathrm{ns}$

## Note

All parameters and waveforms are not applicable to all devices.

A. The outputs are measured one at a time, with one transition per measurement.

## 8 Detailed Description

### 8.1 Overview

The TXB0104 device is a 4-bit, directionless voltage-level translator specifically designed for translating logic voltage levels. The A port is able to accept I/O voltages ranging from 1.2 V to 3.6 V , while the B port can accept I/O voltages from 1.65 V to 5.5 V . The device is a buffered architecture with edge-rate accelerators (one-shots) to improve the overall data rate. This device can only translate push-pull CMOS logic outputs. If for open-drain signal translation, please refer to Tl's TXS010X products.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

### 8.3.1 Architecture

The TXB0104 device architecture (see Figure 8-1) does not require a direction-control signal to control the direction of data flow from $A$ to $B$ or from $B$ to $A$. In a DC state, the output drivers of the device maintain a high or low, but are designed to be weak, so the output drivers can be overdriven by an external driver when data on the bus flows the opposite direction.

The output one-shots detect rising or falling edges on the A or B ports. During a rising edge, the one-shot turns on the PMOS transistors (T1, T3) for a short duration, which speeds up the low-to-high transition. Similarly, during a falling edge, the one-shot turns on the NMOS transistors (T2, T4) for a short duration, which speeds up the high-to-low transition. The typical output impedance during output transition is $70 \Omega$ at $\mathrm{V}_{\mathrm{CCO}}=1.2 \mathrm{~V}$ to 1.8 V , $50 \Omega$ at $\mathrm{V}_{\mathrm{CCO}}=1.8 \mathrm{~V}$ to 3.3 V , and $40 \Omega$ at $\mathrm{V}_{\mathrm{CCO}}=3.3 \mathrm{~V}$ to 5 V .

Figure 8-1. Architecture of TXB0104 Device I/O Cell

### 8.3.2 Input Driver Requirements

Typical $\mathrm{I}_{\mathbb{N}}$ vs $\mathrm{V}_{\mathbb{I N}}$ characteristics of the device are shown in Figure 8-2. For proper operation, the device driving the data I/Os of the TXB0104 device must have drive strength of at least $\pm 2 \mathrm{~mA}$.

A. $V_{T}$ is the input threshold of the TXB0104 device, (typically $V_{C C} / 2$ ).
B. $V_{D}$ is the supply voltage of the external driver.

Figure 8-2. Typical $\mathrm{I}_{\mathrm{IN}}$ vs $\mathrm{V}_{\mathrm{IN}}$ Curve

### 8.3.3 Output Load Considerations

TI recommends careful PCB layout practices with short PCB trace lengths to avoid excessive capacitive loading and to ensure that proper O.S. triggering takes place. PCB signal trace-lengths must be kept short enough such that the round trip delay of any reflection is less than the one-shot duration. This improves signal integrity by ensuring that any reflection sees a low impedance at the driver. The O.S. circuits have been designed to stay on for approximately 10 ns . The maximum capacitance of the lumped load that can be driven also depends directly on the one-shot duration. With very heavy capacitive loads, the one-shot can time-out before the signal is driven fully to the positive rail. The O.S. duration has been set to best optimize trade-offs between dynamic ICC, load driving capability, and maximum bit-rate considerations. Both PCB trace length and connectors add to the capacitance that the device output sees, so it is recommended that this lumped-load capacitance be considered to avoid O.S. retriggering, bus contention, output signal oscillations, or other adverse system-level affects.

### 8.3.4 Enable and Disable

The TXB0104 device has an OE input that is used to disable the device by setting OE = low, which places all I/Os in the high-impedance (Hi-Z) state. The disable time ( $\mathrm{t}_{\text {dis }}$ ) indicates the delay between when OE goes low and when the outputs acutally get disabled ( $\mathrm{Hi}-\mathrm{Z}$ ). The enable time ( $\mathrm{t}_{\mathrm{e}}$ ) indicates the amount of time the user must allow for the one-shot circuitry to become operational after OE is taken high.

### 8.3.5 Pullup or Pulldown Resistors on I/O Lines

The device is designed to drive capacitive loads of up to 70 pF . The output drivers of the TXB0104 device have low dc drive strength. If pullup or pulldown resistors are connected externally to the data I/Os, their values must be kept higher than $50 \mathrm{k} \Omega$ to ensure that they do not contend with the output drivers of the TXB0104 device.

For the same reason, the TXB0104 device must not be used in applications such as $\mathrm{I}^{2} \mathrm{C}$ or 1 -Wire where an open-drain driver is connected on the bidirectional data I/O. For these applications, use a device from the TI TXS01xx series of level translators.

### 8.4 Device Functional Modes

The device has two functional modes, enabled and disabled. To disable the device, set the OE input to low, which places all I/Os in a high impedance state. Setting the OE input to high will enable the device.

## 9 Application and Implementation

## Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. Tl's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The TXB0104 device can be used in level-translation applications for interfacing devices or systems operating at different interface voltages with one another. It can only translate push-pull CMOS logic outputs. If for open-drain signal translation, please refer to TI TXS010X products. Any external pulldown or pullup resistors are recommended larger than $50 \mathrm{k} \Omega$.

### 9.2 Typical Application

### 9.2.1 Design Requirements

For this design example, use the parameters listed in Table 9-1. And make sure the $\mathrm{V}_{\mathrm{CCA}} \leq \mathrm{V}_{\mathrm{CCB}}$.
Table 9-1. Design Parameters

| DESIGN PARAMETERS | EXAMPLE VALUE |
| :---: | :---: |
| Input voltage range | 1.2 V to 3.6 V |
| Output voltage range | 1.65 V to 5.5 V |

### 9.2.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range
- Use the supply voltage of the device that is driving the TXB0104 device to determine the input voltage range. For a valid logic high, the value must exceed the $\mathrm{V}_{\mathrm{IH}}$ of the input port. For a valid logic low, the value must be less than the $\mathrm{V}_{\mathrm{IL}}$ of the input port.
- Output voltage range
- Use the supply voltage of the device that the device is driving to determine the output voltage range.
- External pullup or pulldown resistors are not recommended. If mandatory, it is recommended that the value must be larger than $50 \mathrm{k} \Omega$.
- An external pulldown or pullup resistor decreases the output $\mathrm{V}_{\mathrm{OH}}$ and $\mathrm{V}_{\mathrm{OL}}$. Use the below equations to draft estimate the $\mathrm{V}_{\mathrm{OH}}$ and $\mathrm{V}_{\mathrm{OL}}$ as a result of an external pulldown and pullup resistor.
$\mathrm{V}_{\mathrm{OH}}=\mathrm{V}_{\mathrm{CCx}} \times \mathrm{R}_{\mathrm{PD}} /\left(\mathrm{R}_{\mathrm{PD}}+4.5 \mathrm{k} \Omega\right)$
$\mathrm{V}_{\mathrm{OL}}=\mathrm{V}_{\mathrm{CCx}} \times 4.5 \mathrm{k} \Omega /\left(\mathrm{R}_{\mathrm{PU}}+4.5 \mathrm{k} \Omega\right)$
Where
- $\mathrm{V}_{C C x}$ is the output port supply voltage on either $\mathrm{V}_{\mathrm{CCA}}$ or $\mathrm{V}_{\mathrm{CCB}}$
- $R_{P D}$ is the value of the external pull down resistor
- $R_{P U}$ is the value of the external pull up resistor
- $4.5 \mathrm{k} \Omega$ is the counting the variation of the serial resistor $4 \mathrm{k} \Omega$ in the $\mathrm{I} / \mathrm{O}$ line.

### 9.2.3 Application Curves

Figure 9-1. Level-Translation of a $2.5-\mathrm{MHz}$ Signal

## 10 Power Supply Recommendations

During operation, ensure that $\mathrm{V}_{\mathrm{CCA}} \leq \mathrm{V}_{\mathrm{CCB}}$ at all times. During power-up sequencing, $\mathrm{V}_{\mathrm{CCA}} \geq \mathrm{V}_{\mathrm{CCB}}$ does not damage the device, so any power supply can be ramped up first. The device has circuitry that disables all output ports when either $\mathrm{V}_{\mathrm{CC}}$ is switched off ( $\mathrm{V}_{\mathrm{CCAAB}}=0 \mathrm{~V}$ ). The output-enable ( OE ) input circuit is designed so that it is supplied by $\mathrm{V}_{\mathrm{CCA}}$ and when the (OE) input is low, all outputs are placed in the high-impedance state. To ensure the high-impedance state of the outputs during power up or power down, the OE input pin must be tied to GND through a pulldown resistor and must not be enabled until $\mathrm{V}_{\mathrm{CCA}}$ and $\mathrm{V}_{\mathrm{CCB}}$ are fully ramped and stable. The minimum value of the pulldown resistor to ground is determined by the current-sourcing capability of the driver.

## 11 Layout

### 11.1 Layout Guidelines

To ensure reliability of the device, following common printed-circuit board layout guidelines is recommended.

- Bypass capacitors must be used on power supplies, and must be placed as close as possible to the $\mathrm{V}_{\mathrm{CCA}}$, $V_{C C B}$ pin and GND pin.
- Short trace-lengths must be used to avoid excessive loading.
- PCB signal trace-lengths must be kept short enough so that the round-trip delay of any reflection is less than the one-shot duration, approximately 10 ns , ensuring that any reflection encounters low impedance at the source driver.

### 11.2 Layout Example

## 12 Device and Documentation Support

### 12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on Subscribe to updates to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 12.2 Support Resources

TI E2E ${ }^{\text {TM }}$ support forums are an engineer's go-to source for fast, verified answers and design help - straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

### 12.3 Trademarks

${ }^{\text {тм }}$ is a trademark of Texas Instruments.
TI E2E ${ }^{\text {TM }}$ is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

### 12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.
ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 12.5 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).
For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

Exposed Thermal Pad Dimensions

NOTE: All linear dimensions are in millimeters

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com [http://www.ti.com](http://www.ti.com).
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
F. Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.
